North Carolina

Mobile Homeowners Policy

MH(C) Program

1. Definitions

A mobile home is defined as a factory fabricated, transportable permanent housing unit, which is at least 8 body feet in width or 32 body feet in length, built on a chassis and designed to be used as a dwelling with or without a permanent foundation when connected to the required utilities. It may be equipped with one or more room sections that fold, collapse or telescope into the principal unit when being transported and which can be expanded at the site to provide additional living area. Running gear consisting of wheels and tires may be removed while it is being lived in, but can be readily re-installed.

2. Policy and Forms

Coverage will be written on the Mobile Home Owner Policy MH(C) Form which will consist of:

- a. Mobile Home Owner Policy MH(C), plus
- b. Mobile Home Owner Policy - Page One, or;
- c. Required endorsements, if any.

3. Terms Rule

The policy may be written for a maximum of seven years (84 months) at the Term Factors shown in the Rate Section. If a policy is issued for a period of less than twelve months and for a term not shown in the Term Factor chart it will be written short rate and the premium for the policy shall be computed in accordance with the short rate table, except that in the following circumstances the premium will be computed pro rata:

- a. When coverage is afforded to secure a common inception date with other coverages or lines of insurance.
- b. To replace an outstanding policy of a company in liquidation, provided a new policy is based upon the rules and rates in effect at the time replacement is made and will be in effect for a period equal to the unexpired term of the outstanding policy.

If a policy is issued for a period of more than twelve months and for a term not shown in the Term Factor chart, it will be computed at the full premium for each full year and pro rata for any portion of a year.

4. Premium Rules (General)

The premium will be rounded to the nearest whole dollar. A premium involving \$0.50 or over will be rounded to the next whole dollar.

The procedure will apply to all interim premium adjustments including endorsements, or cancellations at the request of the insured. In the case of cancellation by the Company, the return premium may be carried to the next higher whole dollar.

Any rating discrepancy involving a premium of \$2.00 or less may be waived except, that an overcharge shall be refunded, regardless of amount, if requested by the insured.

5. Minimum Written Premium Rule

No policy may be written for less than \$30.00 regardless of the term. The Trip Coverage premium and the Secured Interest Protection premium are in addition to the \$30.00 Minimum Written Premium. No additional premium charge will be less than \$6.00.

6. Minimum Earned Premium Rule

The Minimum Short Rate Earned Premium will not be less than \$30.00. Trip Coverage premium shall be fully earned.

MOBILE HOMEOWNERS POLICY: MH(C) PROGRAM

7. Changes

- a. All changes requiring adjustments of premium shall be computed pro rata.
- b. If a mobile home or a form of coverage that was cancelled from a policy at the request of the insured is reinstated within 30 days, the premium will be the same as the amount that was returned at the time of cancellation.
- c. Minimum Premiums: If an outstanding policy is amended and results in a premium adjustment, that adjustment shall not be less than \$6.00, except that the actual return premium will be allowed at the request of the insured.

8. Cancellation Rule

Cancellation may be effected as follows:

- a. The insured can cancel the policy by mailing to the Company a written notice telling the Company the future date cancellation is to be effective if a lien holder is named on Page One of the policy, the Company will mail to the lien holder ten days written notice of cancellation of the lien holder's interest in this policy.
- b. When a lien holder named in the policy has repossessed or has otherwise acquired ownership of the mobile home, the lien holder may, for the account of all parties at interest under the policy, cancel the policy by surrendering it to the Company.
- c. The Company can cancel the policy for any reason during the first 60 days. The Company can cancel the policy after the first 60 days only if the insured or his representative:
 - Conceal, omit or misrepresent any material facts or circumstances, or make a false or fraudulent claim, or
 - Fail to comply with any governmental requirement regulating mobile home tie-down or anchoring systems, or
 - Have knowledge of any change that substantially increases the risk assumed by the Company without notifying the Company, and paying any required premium for the increased risk, or
 - Has not paid the premium.
 - The Company will mail a cancellation notice to the insured at least 30 days (non-payment 10 days) before the policy is cancelled. The Company will mail a cancellation notice to the insured's last address known to the Company or the agent. The Company will also give the same notice to the lien holder.
- d. Computation
 - (1) Cancellation by the named insured on any policy within one year of its inception date will be computed short rate, using the appropriate short rate chart. All other cancellations will be pro rata.
 - (2) Cancellation by any other party at interest will be pro rata regardless of policy term.
 - (3) No endorsement will have the effect of violating the Written or Earned Premium rules.

9. Tenants Coverage Rule

The Mobile Home Owner Policy MH(C) may also be issued to a tenant (non-owner) of a mobile home, for any of the following coverages:

- a. Comprehensive Personal Effects;
- b. Comprehensive or Named Perils Adjacent Structures;
- c. Liability.

If the policy includes Comprehensive Personal Effects Coverage, Mobile Home Tenants Coverage Endorsement is to be attached automatically affording the following additional policy coverages:

- a. Additional Living Expense;
- b. Fire Department service;
- c. Credit Card and Depositors Forgery.

The additional coverages are excess over any other collectible insurance.

MOBILE HOMEOWNERS POLICY: MH(C) PROGRAM

10. Natural Disaster Protection Rules

Coverage may be afforded under each policy insuring a financed mobile home. It amends the amount of the Company's liability to the outstanding principal balance of the loan or the amount which would be recoverable under the policy, whichever is greater, if total loss results from Perils covered. For rate information, refer to the Rate Section.

11. Seasonal/Vacation Mobile Home Rule

A seasonal/vacation mobile home is defined as a mobile home that is not the primary residence of the insured, but one that is used on an intermittent basis by the insured and his (her) immediate family. It may not be rented to others. Mobile homes that are rented to others for seasonal or vacation use are not eligible for the Mobile Home Owner Policy MH(C). A minimum deductible of \$250 shall automatically apply to Comprehensive or Named Perils Mobile Home Structures Coverage, Comprehensive Personal Effects Coverage, and Comprehensive or Named Perils Adjacent Structures Coverage.

12. Deductible Rule

The basic rates in the Rate Section contemplate a \$100 deductible for *Comprehensive* Primary Residence and Tenants, \$0 deductible for *Named Perils* Primary Residence and Tenants, and \$250 deductible for *Comprehensive and Named Perils* Seasonal/Vacation. This deductible amount may be modified as provided for in the rate section.

In Territories 110, 120, 130, 140, 150, and 160, the Mobile Homeowners Policy may be endorsed to provide an optional Windstorm or Hail Deductible used in conjunction with the deductibles applicable to All Other Perils. This option provides for higher dollar deductible amounts of \$1,000, \$2,000, and \$5,000 when the higher deductible amount selected exceeds the deductible applicable to All Other Perils.

In Territories 110, 120, 130, 140, 150, and 160, the Mobile Homeowners Policy may be endorsed to provide a Named Storm Percentage Deductible of 1% of the Mobile Home Structures, Adjacent Structures, or Comprehensive Personal Effects limit of liability, whichever is greatest, when the dollar amount of the percentage deductible exceeds the deductible applicable to All Other Perils. Use **MH(C)-320** Named Storm Percentage Deductible.

13. Fire Department Service Charge

The \$100 Fire Department Service Charge may be increased for an additional premium as provided for in the Rate Section.

14. Radio and Television Antenna Coverage

The \$50 Radio and Antenna Coverage may be increased for an additional premium as provided for in the Rate Section.

15. Inflation Coverage

This form may be attached to the policy when the mobile home is used as the primary residence or as a seasonal/vacation residence. For rate information, refer to the Rate Section.

16. Rentals

A Mobile Home Owner Policy MH(C) may be written to cover the interest of the owners of a rented mobile home.

17. Tie-Down:

When the mobile home is properly secured in accordance with the regulations of the North Carolina Building Code Council as set forth in the State of North Carolina Regulations for mobile homes, a credit of 10% shall be deducted from the rates applicable to the following coverages:

- a. Comprehensive or Named Perils Mobile Home Structures Coverage
 - b. Comprehensive Personal Effects Coverage
-

18. Personal Effects Replacement Cost

For an additional premium your policy may be extended to cover the full cost of repair or replacement without deduction for depreciation of your personal effects. For rate information see Rate Section.

Attach Comprehensive Personal Effects Replacement Cost Endorsement.

MOBILE HOMEOWNERS POLICY: MH(C) PROGRAM

19. Replacement Cost Coverage

For an additional premium your policy may be extended to cover the cost of repair or replacement without deduction for depreciation of your mobile home. For rate information see Rate Section.

Attach MH(C) Mobile Home Replacement Cost Coverage (Ed. 8-85).

20. Additional Living Expense Coverage

For an additional premium the \$10 per day coverage for a maximum of 60 days may be increased. For rate information see Rate Section.

21. Windstorm or Hail Exclusion - Territories 110, 120, 130, 140, 150, and 160 only

The perils of windstorm or hail may be excluded from coverage if the insured purchases a separate policy for windstorm or hail from the North Carolina Insurance Underwriting Association at the premium credit developed from the Premium Section of this manual.

The Peril of Windstorm or Hail may be excluded if:

- a. The property is located in an area eligible for such coverage from the North Carolina Insurance Underwriting Association; and
- b. A Windstorm or Hail Rejection Form is secured and maintained by the Company.

Attach Endorsement **MH(C)-306** Windstorm or Hail Exclusion Endorsement.

When Endorsement **MH(C)-306** is attached to the policy, enter the following on the Declarations Page:

"This policy does not provide coverage for the peril of Windstorm or Hail."

22. Installment Payment Plan

When a policy is issued on an installment basis, the following rules apply:

- a. The first installment shall be due on the effective date of the policy and the due date of the last installment shall be no later than one month prior to the policy anniversary date.
- b. An additional charge of \$3.00 shall be made for each installment.
- c. The premium calculated for the first installment payment, exclusive of installment charges, shall not be less than the pro rata charge for the period from the inception date of policy to the due date of the next installment.

23. Stated Value Loss Settlement

For an additional premium, your policy may be changed to reflect a stated value for the covered mobile home. For rate information, see Rate Section.

Attach **MH(C)-310** (Ed. 9-97)

24. Optional Rating Characteristics

Companies may use the following optional rating characteristics or any combination of such optional rating characteristics and Bureau filed characteristics to determine rates, as long as applicable legal requirements are satisfied. The resulting premium shall not exceed the premium that would have been determined using the rates, rating plans, classifications, schedules, rules and standards promulgated by the Bureau, except as provided by statute. The rating factor for any combination of the following optional risk characteristics cannot exceed 1.00, unless the resulting premium does not exceed the Bureau premium.

- a. Policy characteristics not otherwise recognized in this manual. Examples include: account or multi-policy credit; tiers; continuity of coverage; coverages purchased; intra-agency transfers; payment history; payment options; prior insurance; and new and renewal status.
- b. Policyholder/Insured personal characteristics not otherwise recognized in this manual. Examples include: Smoker/non-smoker status; credit information; loss history; loss prevention training/education; age; work status; marital status; number of years owned; owned real estate; household composition; and good student/education.

MOBILE HOMEOWNERS POLICY: MH(C) PROGRAM

- c. Dwelling characteristics not otherwise recognized in this manual. Examples include: Gated community; retirement community; limited access community; mobile home community; revitalized/renovated mobile home; security, safety or loss deterrent systems or devices; age of mobile home; occupancy; fire protection/distance to fire department; and construction type and quality.
- d. Affinity group or other group not otherwise recognized in this manual.
- e. Any other rating characteristics or combination of characteristics if filed by a company and approved by the Commissioner.

25. Scheduled Personal Property

Coverage may be provided against all risks of physical loss with certain exceptions on scheduled personal property subject to the rules and rates filed by or on behalf of the Company.

Attach endorsement **MH(C)-2598** Scheduled Personal Property and **MH(C)-4344** Valuable Personal Property List.

26. Territory Groups

For rating purposes, territories are grouped as follows:

Territory Group 1: Territories 110, 120, 130, and 140

Territory Group 2: Territories 150 and 160

Territory Group 3: Territories 180, 190, 200, 210, 220, and 230

Territory Group 4: Territories 170, 240, and 250

Territory Group 5: Territories 260, 270, 280, 290, and 300

**WINDSTORM OR HAIL DEDUCTIBLES
TERRITORY GROUPS 1 AND 2 ONLY**

The Windstorm or Hail Deductible options are used in conjunction with the deductibles applicable to All Other Perils. This option provides for higher dollar deductible amounts of \$1,000, \$2,000, and \$5,000 when the higher deductible amount selected exceeds the deductible applicable to All Other Perils.

An endorsement is not required. Separately enter on the policy declarations the deductible amounts that apply to Windstorm or Hail and All Other Perils. For example: Deductible - \$500 except \$1,000 for Windstorm or Hail.

The factors displayed incorporate the factors for the All Perils Deductibles. Do not use the factors for the All Perils Deductibles when rating a policy with a higher Windstorm or Hail deductible.

COMPREHENSIVE

The Windstorm or Hail Deductible factor applies to the \$100 Deductible rate.

250,000	32.78
300,000	34.97

INFLATION COVERAGE

\$5.00 per mobile home

DETERMINATION OF TERM PREMIUMS

Multiply the 1 year unrounded premium for the specific coverage by the term factor then total and round total of all coverages.

TERM FACTORS

Apply to all Coverages:

Term	1 Year	2 Year	3 Year	4 Year	5 Year	6 Year	7 Year
Factor	1.00	2.00	3.00	3.85	4.65	5.35	6.00

PERSONAL EFFECTS REPLACEMENT COST ENDORSEMENT

\$0.30 per \$100 of Insurance
The Minimum Additional Premium is \$15.00

REPLACEMENT COST COVERAGE

When coverage is provided on a replacement cost basis, charge 5% of the premium from the premium rate table.

MOBILE HOME ADDITIONAL LIVING EXPENSE COVERAGE

\$25 per day = \$6 per mobile home
\$50 per day = \$16 per mobile home

WINDSTORM OR HAIL EXCLUSION

(Territories 110, 120, 130, 140, 150, 160)

Mobile Home Structures	59.6%
Adjacent Structures	37.9%
Comprehensive Personal Effects	38.9%

STATED VALUE LOSS SETTLEMENT

When coverage is provided on a stated value basis, charge 3% of the premium from the premium rate table.

1. TERRITORY ASSIGNMENTS

If a territory shown is defined in terms of United States Postal Service (USPS) ZIP code:

A. Determine the applicable rating territory based on the location of the dwelling.

B. An insured's rates shall not be changed solely because the USPS changed his or her ZIP code and the physical boundaries of a rating territory shall be determined by the ZIP code boundaries in effect at the time of the latest rate filing defining the territory. Territory boundaries in North Carolina are concurrent with USPS ZIP code boundaries in effect as of **July 1, 2013**. If the USPS introduces a new ZIP code or realigns a ZIP code boundary after **July 1, 2013**, the new ZIP code may not yet be listed in Rule **2.C**. If this is the case, assign the rating territory based on the ZIP code boundary that formerly applied to the dwelling before the USPS changed the ZIP code.

2. TERRITORY DEFINITIONS – (For all Coverages and Perils Other than Earthquake).

Assign the applicable territory using the following order of priority:

A. County of

	Code
Alamance	310
Alexander	340
Alleghany	360
Anson	300
Ashe	360
Avery	370
Beaufort	150

B. Beach Areas

Beach Area – Localities south and east of the Inland Waterway from the South Carolina Line to Fort Macon (Beaufort Inlet), thence south and east of Core, Pamlico, Roanoke and Currituck Sounds to the Virginia Line, being those portions of land generally known as the "Outer Banks".

Beach areas in Currituck, Dare, and Hyde Counties: 110

Beach areas in Brunswick, Carteret, New Hanover,

Onslow, and Pender Counties: 120

C. Other than Beach Areas of Brunswick, Carteret, New Hanover, Onslow, and Pender Counties

For areas of Brunswick, Carteret, New Hanover, Onslow and Pender Counties, other than the Beach Areas, refer to the following ZIP codes. If portions of these ZIP codes fall in Counties other than Brunswick, Carteret, New Hanover, Onslow and Pender Counties use the territory code for those Counties.

1. Eastern Coastal Territory

PRE-FILED TESTIMONY
OF
RAYMOND F. EVANS, JR., CPCU

MOBILE HOME (C) PROGRAM
RATE FILING
BY THE NORTH CAROLINA RATE BUREAU

February 2021

- Q. Would you state your full name and address?
- A. Raymond F. Evans, Jr. My business address is 2910 Sumner Blvd, Raleigh, North Carolina 27616.
- Q. Are you employed by the North Carolina Rate Bureau ("Bureau")?
- A. Yes.
- Q. In what capacity?
- A. I am the General Manager.
- Q. How long have you been employed by the Bureau?
- A. Since September, 2000.
- Q. Would you summarize your educational background?
- A. I graduated from Ohio State University with a Bachelor of Science Degree in Accounting. I am also a Chartered Property and Casualty Underwriter.
- Q. What was your work experience after graduation and prior to beginning work for the Bureau?
- A. From March 1966 to August 2000, I worked in various capacities with the State Automobile Insurance Companies.
- Q. What is the Bureau's function with respect to rates for Mobile Home (C) insurance?
- A. The Bureau promulgates rules and rates for residential property insurance written in North Carolina.
- Q. Can you identify Exhibits RB-1 through RB-26?
- A. Yes. This is the 2021 filing (the "Filing") submitted by the Bureau to the Honorable Mike Causey, Commissioner of Insurance, with respect to revised mobile home (C) insurance rates in North Carolina.

- Q. Do you know how the expense data underlying the Filing was compiled?
- A. Yes. The underwriting expense provisions included in the Filing were derived from a special call for expense experience that is issued on an annual basis by the North Carolina Rate Bureau to all member companies of the Bureau. The responses received from that special call were compiled, reviewed by the Bureau and furnished to Milliman for incorporation into the Filing. The expense data were checked, reconciled and edited by the Bureau before they were sent to Milliman for use in the Filing.
- Q. Can you identify the document (Exhibit RB-2) entitled the North Carolina Mobile Homeowners Policy Program MH(C)?
- A. Yes. The North Carolina Mobile Homeowners Policy Program is a manual of the rules, rates and classifications used to write Mobile Homeowners insurance in North Carolina. This manual and any approved amendments are on file with the North Carolina Department of Insurance and a copy is maintained at the offices of the Bureau.
- Q. Has the Bureau furnished to Milliman, for use in this Filing, information appearing in the Annual Statements and the Insurance Expense Exhibits of its member companies?
- A. Yes.
- Q. How was that information obtained by the Bureau?
- A. Information from the Annual Statements and the Insurance Expense Exhibits was obtained from a special data call by the Bureau, based on Annual Statements and Insurance Expense Exhibits filed by companies with the Insurance Department. The Annual Statements and the Insurance Expense Exhibits are part of the official records maintained at the Department of Insurance.
- Q. Was the special call, annual statement and insurance expense exhibit information that was furnished to Milliman in connection with the Filing correct and accurate to the best of your knowledge, information and belief?
- A. Yes.
- Q. Does the Bureau have actuaries on its staff?
- A. Yes, we have an actuary on staff.
- Q. To the extent that additional actuarial expertise was necessary in the preparation of this Filing, where did the Bureau obtain that expertise?
- A. Actuarial expertise was obtained from Milliman and from members of the various Property Committees of the Bureau. The Mobile Home Subcommittee, the Property Rating Subcommittee, and the Property Committee reviewed the data underlying this Filing and made recommendations to the Governing Committee of the Bureau as to the items contained in the Filing, and many of the company representatives on these committees are actuaries. Milliman is retained by the Bureau to provide

actuarial services to the Bureau for, among numerous other things, preparation of this Filing.

Q. What is the proposed effective date of the rates in the Filing?

A. The proposed rule of application provides that the new rates will apply to all policies becoming effective on or after November 1, 2021.

Q. Does the Filing include, to the extent available, the information to be furnished in connection with filings under Article 36 of Chapter 58 of the General Statutes?

A. Yes. Those data that were available have been submitted to the Commissioner as part of the Filing. As shown and explained in that submission, some data were not collected or, if collected, were not retrievable from the data in the form requested. The individual circumstances with respect to such data are explained in the submission.

Q. Does that conclude your pre-filed testimony?

A. Yes.

**PREFILED TESTIMONY
OF
PAUL D. ANDERSON, FCAS, CSPA, MAAA**

**2021 MOBILE HOMEOWNERS MH(C) INSURANCE RATE FILING
BY THE NORTH CAROLINA RATE BUREAU**

Q. Please state your name and business address.

A. My name is Paul D. Anderson. My business address is 15800 West Bluemound Road, Brookfield, WI 53005.

Q. By whom are you employed?

A. I am employed by Milliman, Inc. (Milliman) and have been employed by Milliman since February 1, 2007.

Q. What is your educational background?

A. I received a Bachelor of Science in Actuarial Science from Drake University in Des Moines, Iowa in 1993.

Q. Do you have any additional certifications or qualifications?

A. Yes. I have been a Fellow of the Casualty Actuarial Society (CAS) since 2002 and a Certified Specialist in Predictive Analytics of the CAS Institute (iCAS) since 2018. Since 2002, I have served on several committees of the Casualty Actuarial Society, including the following:

- Syllabus & Examination Committee: April 2004 to July 2006;
- Volunteer Support Task Force: February 2012 to April 2013;
- Volunteer Resources Committee: April 2013 to March 2020;
- Vehicle Technology & Impact on Loss Trends Planning Committee: October 2017 to August 2018;
- Participation Survey Task Force: January 2018 to Present;
- Crash Course in Vehicle Technology & Driverless Cars Committee (chairperson): February 2020 to Present; and
- Volunteer Resources Advisory Committee: June 2020 to Present.

I have also been a member of the American Academy of Actuaries since 2002. I meet all of the continuing education requirements of and am in good standing with that organization and the Casualty Actuarial Society.

Q. What is your employment background?

A. I was employed by Allstate Insurance Company from June 1993 until January 2007. While at Allstate, I held various actuarial roles. I began my career as an Auto Pricing Analyst, and over time, I assumed increasing responsibility in various departments that included Property Pricing, Auto Pricing, Property Research, and Auto Research. On the pricing teams, I assisted in developing rates for property and auto insurance products in most states across the country. On the research teams, I assisted in developing new property and auto risk classification plans to be implemented by Allstate's pricing teams. From 2006 until January 2007, I served as a Senior Manager for Allstate's Eastern region, which included assisting in the oversight of the pricing strategies for approximately half the country, including North Carolina.

In February 2007, I began my career at Milliman. Since 2007, I have completed, managed, or overseen numerous property and auto pricing analyses for a variety of clients. My clients have included small single-state insurance companies, industry-leading national insurance companies, government entities, the North Carolina Rate Bureau, and other entities with similar coastal property exposure in states such as Florida and Texas. These client assignments have included such projects as pricing analyses to evaluate overall rate adequacy, predictive modeling assignments to develop new risk classification plans, and analyses of catastrophe losses to evaluate the adequacy and allocation of property premiums corresponding to catastrophe risk.

Q. What is Milliman?

A. Milliman is among the world's largest independent actuarial and consulting firms. Milliman was founded in Seattle in 1947 as Milliman & Robertson and today has offices in principal cities worldwide, covering markets in North America, Latin America, Europe, Asia and the Pacific, the Middle East, and Africa. Milliman employs more than 4,000 people, including actuaries and specialists ranging from clinicians to economists. The firm has consulting practices in employee benefits, financial services, healthcare, life insurance, and property and casualty insurance. Milliman serves the full spectrum of business, education, financial, governmental, union, and nonprofit organizations.

Q. What are your current responsibilities at Milliman?

A. I am responsible for managing and overseeing the personal lines and insurance-related predictive analytics portion of Milliman's Milwaukee Casualty practice. The personal lines and predictive analytics team conducts a variety of property and auto pricing, product development, and predictive modeling assignments, primarily for insurance companies. Over the last five years, we have completed property analyses for clients in nearly every state in the country, including North Carolina.

Q. Were you engaged to provide actuarial services to the North Carolina Rate Bureau (Rate Bureau or Bureau) in relation to its 2021 mobile homeowners MH(C) rate filing?

A. Yes, I was.

Q. What work did Milliman perform in connection with the rate review and this rate filing?

A. Milliman was engaged to provide actuarial ratemaking services directly to the Rate Bureau to assist in the preparation of the 2021 mobile homeowners MH(C) rate review. As such, I was involved in several aspects of the preparation of this filing.

First, under the direction of the Rate Bureau, Milliman developed and administered a Mobile Homeowners Data Call. In response to this data call, Milliman received data from Bureau member companies that write mobile homeowners insurance in North Carolina. Milliman compiled the data and reviewed the data for reasonability and consistency. In addition to data from the data call, Milliman received and evaluated expense-related data that the Rate Bureau collected from its member companies. Throughout this analysis, Milliman also received modeled hurricane data and net cost of reinsurance data from Aon. Milliman aggregated all of this data and reviewed each component for reasonability.

Second, I and other Milliman staff under my direction compiled the ratemaking data to be reviewed by the Bureau's Property Rating Subcommittee, Property Committee, and Governing Committee in preparation for the rate review.

Third, Milliman staff under my direction assembled the vast majority of the data and performed all of the calculations contained in Exhibits RB-1, RB-5, and RB-6. This process was performed under the ultimate direction of the Bureau committees.

Finally, I reviewed the filed rates to determine whether they are calculated in accordance with applicable actuarial standards and reasonable actuarial methodologies. In conducting this review and making this determination, I adhered to the American Academy of Actuaries' *Code of Professional Conduct*. Based on the guidance of Precept 3 in the *Code of Professional Conduct*, which states that actuarial services shall satisfy applicable standards of practice, I conducted my review in accordance with all Actuarial Standards of Practice (ASOPs) that relate to this filing. A few examples of the ASOPs that I applied during my review include ASOP No. 13, *Trending Procedures in Property/Casualty Insurance*; ASOP No. 39, *Treatment of Catastrophe Losses in*

Property/Casualty Insurance Ratemaking; and ASOP No. 53, Estimating Future Costs for Prospective Property/Casualty Risk Transfer and Risk Retention.

I also conducted my review in accordance with ASOP No. 17, *Expert Testimony by Actuaries*. In addition, I applied the rate standards set forth in the North Carolina General Statutes, including G.S. 58-36-10, which provides that rates must not be excessive, inadequate, or unfairly discriminatory and that certain statutory rating factors must be considered.

Q. Is your firm being compensated for this engagement?

A. Yes, it is.

Q. Is that compensation in any way contingent on providing favorable testimony in support of the filing?

A. No, it is not.

Q. Were there any constraints placed on your analysis, such as limited or delayed access to data or limited time, that may have hindered your complete review?

A. No, I was provided all the data and information necessary for my work, and I had adequate time for a complete analysis. My analysis was not limited in any way.

Q. What is the source of the data evaluated in Exhibit RB-1?

A. The ratemaking data reflected in Exhibit RB-1 was, in general, supplied by the individual insurance companies that write mobile homeowners insurance policies in North Carolina. Those companies submitted their data in response to the mobile homeowners data call described above. Data received in response to the data call included the following:

- Premium data – policy-level data with rating characteristics needed to calculate mobile homeowners premium;
- Claims data – claims-level data including cause of loss;
- Severe weather data – at least 15 years of summarized losses for non-hurricane wind, hurricane, flood, and all (non-liability) perils combined; and
- Loss development data – 12 years of summarized loss and claim data by accident year evaluated at successive evaluation dates.

After receiving the data from the individual insurance companies, Milliman reviewed and verified each company's data and then consolidated the data for use in the rate review analysis.

The individual insurance companies that write mobile homeowners policies in North Carolina also submitted expense-related data to the North Carolina Rate

Bureau. The Rate Bureau reviewed the expense data for reasonability and aggregated the data before providing it to Milliman for final review and consolidation.

During the rate review analysis, Milliman also received modeled hurricane losses and net cost of reinsurance data from Aon. After receiving the data from Aon, Milliman reviewed the modeled hurricane losses and reinsurance costs for reasonability.

After consolidating the data from the member companies, the Rate Bureau, and Aon, Milliman produced various exhibits of the combined data in a format and detail necessary for review by the Rate Bureau committees and ultimately for use in rate filings.

Q. What statistical data supporting this filing are contained in Exhibit RB-1?

- A. In general, the supporting data for the indicated and proposed rate changes are contained in Sections C and D. The most recent five years of loss experience are summarized and displayed in Section C. The experience used in this filing includes accident year experience for the years ending December 31, 2015 through December 31, 2019. To clarify what is meant by “accident year,” the losses for the accident year ending December 31, 2019 include all losses resulting from claims caused by events that occurred between January 1, 2019 and December 31, 2019, even if the loss was paid or a reserve established on or after January 1, 2020.

Similar to Section C, the information summarized and displayed in Section D also includes accident year experience for the years 2015 through 2019. However, Section D supports changes to several mobile homeowners rating variables and, as such, the loss experience is summarized by rating characteristic rather than by year.

Q. Why are five years of loss experience used to determine the indicated rate changes?

- A. The objective of ratemaking is to establish rates that are sufficient to cover all expected losses and expenses and to provide a reasonable margin for profit. Rates are prospective and, as such, are developed for the time period during which they will be in effect. For this filing, the proposed rates are assumed to be in effect for one year beginning with the effective date of this filing. Historical loss experience is evaluated for the purpose of projecting expected future losses. For insured losses, including flood losses, but not including hurricane losses (for which hurricane models are used) and not including non-hurricane catastrophic wind losses and flood losses (for which a separate excess wind procedure and a separate excess flood procedure, respectively, are applied), five years of data are considered to be reasonable and appropriate. Using five years of loss

experience to evaluate these losses balances the overall stability of the rates with the responsiveness of the rates to current market conditions. Additionally, North Carolina statutes allow the Rate Bureau to review five years of experience in its rate filings in addition to other factors that are to be considered. Note that, for the purposes of this filing, “hurricane losses” mean wind and storm surge losses from hurricanes.

Previous North Carolina mobile homeowners rate filings submitted by the Rate Bureau have relied on five years of experience with weights of 10%, 15%, 20%, 25%, and 30% applied to each year respectively as a way to balance stability and responsiveness of the proposed rates. With this filing, we use those same weights for the property coverages and the liability coverage being evaluated in this filing. These weights are frequently used and generally accepted in all jurisdictions within the United States.

Q. What is the overall indicated and proposed change in mobile homeowners MH(C) rates in this filing?

- A. This filing shows the indicated need for an overall 22.3% statewide average rate increase for mobile homeowners MH(C) policies. This includes an indicated 26.9% change to Mobile Home Structures rates, an indicated 39.2% change to Adjacent Structures rates, an indicated -6.8% change to Personal Effects rates, and an indicated 11.8% change to Liability rates.

Based on these indicated rate changes, the Rate Bureau’s Governing Committee capped the changes in order to reduce the impact of the rate increases on policyholders and this filing proposes an overall 11.3% statewide average rate increase. This includes a proposed 13.0% change to Mobile Home Structures rates, a proposed 16.2% change to Adjacent Structures rates, a proposed 0.0% change to Personal Effects rates, and a proposed 11.8% change to Liability rates.

Q. Please describe the overall ratemaking methodology that underlies the filing.

- A. The approach in this filing is generally consistent with prior mobile homeowners MH(C) filings submitted by the Rate Bureau. Consistent with ASOP No. 53, *Estimating Future Costs for Prospective Property/Casualty Risk Transfer and Risk Retention* as published by the Actuarial Standards Board, the indicated rates reflect the expected costs associated with insuring mobile homeowners MH(C) policies. These expected future costs include claims, claim settlement expenses, operational and administrative expenses, and a fair and reasonable profit.

The statewide rate indications for mobile homeowners MH(C) policies are developed based on a loss cost methodology (instead of a loss ratio

methodology). The indicated rate change is calculated for each coverage (i.e., Mobile Home Structures, Adjacent Structures, Personal Effects, and Liability) by comparing the required base rate per policy to the current base rate. This comparison of the required and current base rates is consistent with ASOP No. 53 referenced above, is commonly used throughout the industry, and is an actuarially sound method of developing an indicated rate-level change.

Q. Are there any changes in the ratemaking methodology compared to prior filings?

A. Yes. Although the 2021 mobile homeowners MH(C) filing is generally consistent with prior filings, there are several components of this filing that rely on different approaches as compared to the 2019 mobile homeowners MH(C) filing. The following is a summary of these changes:

1. The prior filing relied on available statistical data provided by the various statistical agents in North Carolina. For this filing, at the direction of the Rate Bureau, Milliman collected the data used in its analysis directly from the Rate Bureau member companies.
2. Similar to the excess wind methodology used in both the current and prior filings, a non-hurricane excess flood methodology is introduced in this filing to reduce volatility in rates due to the volatile nature of flood losses.
3. To account for loss adjustment expenses (LAE) in the prior filing, an LAE factor based on the relationship of industry incurred LAE to industry incurred losses in North Carolina was applied to the available statistical incurred losses. For this filing, both losses and allocated loss adjustment expenses (ALAE) were collected from member companies, and an unallocated loss adjustment expense (ULAE) factor was selected based on the ratio of industry incurred ULAE to industry incurred loss & ALAE and was applied to the aggregated incurred loss & ALAE.
4. This filing calculates premium trends using average rating factors. The prior filing referred to this as exposure trend. In addition, the prior filing reviewed these trends by deductible and then calculated a weighted average trend factor based on the trend factors by deductible. In this filing, premium trends are not evaluated by deductible.
5. In this filing, the exposures that were used in the hurricane model runs were first trended to the period the rates will be in effect (i.e., six months beyond the assumed effective date of 11/1/2021). No additional trend was applied to the modeled hurricane losses. In the prior filing, a loss trend factor was applied to the modeled losses and no trend was applied to the exposures.

6. In the calculation of the compensation for assessment risk provision supporting this filing, simulated event-level losses based on the most recent exposure year were unavailable for analysis. As a result, event-level losses from the prior year were trended forward based on summary information provided by the hurricane model vendors. In the prior mobile homeowners filing, event-level losses were available based on exposures evaluated at a time period consistent with the rest of the filing, so no adjustments or trending were needed. This change has minimal impact on the rate-level indications.
7. In this filing, the proforma profit analysis reflects investment income on reinsurance balances. In the prior filing, this adjustment was not included.
8. With this filing, we are revising the amount of insurance relativities for each coverage and introducing additional all-peril, windstorm and hail, and named storm deductible options.

In my opinion, these different approaches used to develop the statewide and by-territory rate indications, and to calculate the premium for individual mobile homeowners policies, are reasonable and actuarially sound.

Q. Looking at Section C, page 1, what is shown on this exhibit?

- A. Section C, page 1 shows the statewide indicated rate changes for the major coverages offered in the North Carolina mobile homeowners MH(C) program. The data shown on this page reflects all MH(C) business written in the state. The MH(C) program consists of four major types of coverages. Overall, the perils insured against by MH(C) policies are similar to those insured against under homeowners policies with the exception that MH(C) policies also provide coverage for losses caused by the perils of earthquake, flood, and landslide.

Q. Referring to row 1 on page 1 of Section C, what is the *total base class loss cost*?

- A. The *total base class loss cost* is the average amount of projected loss per exposure, including both non-hurricane and hurricane losses, for the risk identified as the base class for each respective MH(C) coverage. The calculations underlying the *total base class loss cost* for each coverage are included later in the discussion of Section C, pages 2, 4, 6, and 8.

Q. Please explain each of the items shown in row 2 of Section C, page 1, including the *fixed expense per policy*, *variable expense per policy*, *profit*, *contingencies*, and *policyholder dividends*.

- A. Row 2a shows the *fixed expense per policy* for each MH(C) coverage. These amounts reflect the average costs for general expenses and other acquisition

expenses that are expected to be paid to support policies written between November 1, 2021 and October 31, 2022. General expenses include overhead expenses such as equipment, rent, and salaries. Other acquisition expenses include costs required to issue a policy, excluding commission and brokerage and including such items as advertising fees, postage, and telephone charges. General expenses and other acquisition expenses are fixed expenses in that they do not vary directly in proportion to the amount of premium charged or collected. As a result, the amounts shown in row 2a (e.g., \$54.55 for Mobile Home Structures) are applicable to each mobile homeowners policy that includes the respective MH(C) coverages.

The *fixed expense per policy* for each coverage is calculated on page 71 of Section C and further supported by data found on pages 70 and 72 of Section C. We began by evaluating historical expense information provided by the Rate Bureau and calculating the ratio of general expenses and other acquisition expenses to earned premium for each year from 2015 through 2019. Although we considered the same five years of experience as used in the overall rate indications, the selected expense ratios were based on the most recent three years in order to best reflect any recent shifts in the expense ratios. The selected general expense ratio is 2.9% and the selected other acquisition expense ratio is 14.0%, resulting in a total fixed expense ratio of 16.9%. Because these selections were based on the average expense ratios from 2017 through 2019, the selected 16.9% fixed expense ratio corresponds to the fixed expenses observed at the midpoint of that experience period, or July 1, 2018.

Row 2b shows the *variable expense per policy* for each MH(C) coverage. Unlike fixed expenses, variable expenses vary directly in proportion to the amount of premium charged or collected. As a result, the variable expenses are included in the indicated rate change calculations as percentages relative to the written premium rather than dollar amounts. The variable expense percentage for each MH(C) coverage includes a provision for commission and brokerage and a provision for premium taxes, licenses, and fees. These provisions are supported by data found on page 72 of Section C. Similar to our analysis of the fixed expenses, we evaluated historical expense information and calculated the ratio of commission and brokerage expenses and taxes, licenses, and fees to written premium for each year from 2015 through 2019. We considered the same five years of experience as used in the overall rate indications, however the selected expense ratios were based on the most recent three years in order to best reflect any recent shifts in the expense ratios. The selected commission and brokerage expense ratio is 17.9% and the selected taxes, licenses, and fees expense ratio is 3.1%, resulting in a total variable expense ratio of 21.0%.

Similar to the variable expense ratio, rows 2c, 2d, and 2e contain three additional provisions that vary directly in proportion to the written premium. Row 2c includes a provision for *profit*, row 2d contains a provision for *contingencies*, and row 2e contains a provision for *policyholder dividends*. Each of these selected

provisions is a consistent percentage across the various MH(C) coverages, except for profit, which differs for liability coverage, as noted below.

- The underwriting profit provisions used in this filing are 6.5% for the three major property coverages and 6.0% for liability coverage. These provisions were selected by the Rate Bureau based on analyses completed by Dr. Zanjani and Dr. Vander Weide.
- The selected contingency provision in this filing is 1.0%, which is consistent with the prior mobile homeowners MH(C) filing and other Rate Bureau property insurance filings.
- The provision for policyholder dividends is supported by data on page 74 of Section C. To determine the provision for policyholder dividends, we evaluated historical annual statement information for companies writing Homeowners Multiple Peril premium in North Carolina. (Similar information specific to mobile homeowners insurance is not available.) We calculated the ratio of total dividends to total written premium for homeowners for each year from 2015 through 2019 and observed that companies consistently paid dividends to policyholders during that time period. Because of the consistency of these dividends during the historical experience, the Rate Bureau concluded that a provision for expected policyholder dividends is appropriate and as such, selected a provision of 0.4% in this filing.

Q. In your opinion, are the provisions for general expenses and for other acquisition expenses reasonable?

A. Yes, the general expenses provision and the other acquisition expenses provision are reasonable. It is common practice in the industry to rely on historical experience and to calculate a three-year average expense ratio to determine provisions for general expenses and for other acquisition expenses.

Q. In your opinion, are the provisions for commission and brokerage and for taxes, licenses, and fees reasonable?

A. Yes, the commission and brokerage provision and the taxes, licenses, and fees provision are reasonable. It is common practice in the industry to rely on historical experience and to calculate a three-year average expense ratio to determine provisions for commission and brokerage and for taxes, licenses, and fees.

Q. Is the provision for contingencies included in this filing reasonable?

A. Yes, the selected 1% provision for contingencies is reasonable to include in this filing. In addition to being consistent with prior Rate Bureau filings, the use of a contingency provision is common within the property and casualty insurance industry. According to ASOP No. 30, *Treatment of Profit and Contingency*

Provisions and the Cost of Capital in Property/Casualty Insurance Ratemaking, “the actuary should include a contingency provision if the assumptions used in the ratemaking process produce cost estimates that are not expected to equal average actual costs, and if this difference cannot be eliminated by changes in other components of the ratemaking process.” There are several reasons why expected cost estimates may not be equal to actual costs. Some of these reasons include adverse court decisions, extension of coverage for unforeseen or unintended exposures, regulatory delay or reduction in filed rate changes, and unexpected large losses not sufficiently recognized in the normal ratemaking process. Based on reasons such as those listed above, the Rate Bureau believes a contingency provision is appropriate and necessary.

Included with this filing as Exhibit RB-6 is an exhibit I prepared that summarizes the estimated impact of delays in the filing process within the State of North Carolina. The delay in obtaining rate changes, whether caused by the regulatory review process or other delays inherent in the filing process, is one of several items listed above that supports the use of a contingency provision in a rate-level indication. Exhibit RB-6 lists the fourteen property rate filings submitted by the Rate Bureau between 2008 and 2019. For each filing, I compared the effective date assumed in the rate filing to the actual effective date. This difference, which reflects the delay due to the filing process, ranges from 0 months in the 2019 dwelling filing, to 22 months in the 2011 dwelling filing. After determining the length of delay for each filing, I applied the net trend (i.e., the loss trend offset by the premium trend) in that filing for the number of months of delay to determine the estimated impact of the delay in the filing process on the overall rate level. The estimated impact of delay varies across the fourteen filings, ranging from -1.2% in the 2018 dwelling filing to +5.9% in the 2008 MH(C) mobile homeowners filing, with an average impact of +1.1%.

Based on prior filings submitted by the North Carolina Rate Bureau, my experience with property filings submitted by insurance companies in other states, and the 1.1% estimated impact of delays in the North Carolina filing process, it is my opinion that a 1% contingency provision is reasonable, consistent with common actuarial practice, and appropriate based on fundamental actuarial principles.

Q. Is the provision for policyholder dividends included in this filing reasonable?

A. Yes, as described above, the Rate Bureau evaluated five years of historical experience and selected a 0.4% provision for policyholder dividends based on a five-year average ratio of the total policyholder dividends issued by homeowners insurers in North Carolina to the total direct written premium of those same companies.

The North Carolina ratemaking statutes require that policyholder dividends be considered in setting rates. Also, ASOP No. 29 regarding *Expense Provisions in Property/Casualty Insurance Ratemaking* states the following:

When the actuary determines that policyholder dividends are a reasonably expected expense and are associated with the risk transfer, the actuary may include a provision in the rate for the expected amount of policyholder dividends. In making this determination, the actuary should consider the following: the company's dividend payment history, its current dividend policy or practice, whether dividends are related to loss experience, the capitalization of the company, and other considerations affecting the payment of dividends.

ASOP No. 53 also articulates that future cost estimates should reflect the expected costs associated with insuring mobile homeowners policies, including operational and administrative expenses. As such, since policyholder dividends are an operating expense, it is consistent with ASOP No. 29 and ASOP No. 53 to include a provision for policyholder dividends in the proposed rates reflected in this filing.

By reviewing five years of historical experience to determine a provision for policyholder dividends, the Rate Bureau is complying with the statutes and ASOP No. 53 by considering the dividend payment history and ensuring that the selected provision is a reasonably expected expense.

Q. Referring to row 3 on page 1 of Section C, what is the *base rate excluding reinsurance cost*?

A. The *base rate excluding reinsurance cost* is the average base rate for each coverage before reflecting additional adjustments for the compensation for assessment risk, the net cost of reinsurance, and net deviations. The *base rate excluding reinsurance cost* is calculated based on the following formula:

$$\frac{\text{(total base class loss cost + fixed expense per policy)}}{(1 - \text{variable expense ratio} - \text{profit} - \text{contingencies} - \text{policyholder dividends})}$$

Q. Please explain the item shown in row 4 of Section C, page 1, identified as the *compensation for assessment risk per policy*.

A. There is considerable risk to primary insurers (i.e., the member companies of the Rate Bureau for whom rates are being made in this filing) as a result of the exposures written in the North Carolina Insurance Underwriting Association (i.e., the Coastal Property Insurance Pool, or "Beach Plan") and the North Carolina Joint Underwriting Association (i.e., the FAIR Plan). Together, the Beach Plan and FAIR Plan serve as the "residual market" for residential property insurance in North Carolina. These two entities provide property insurance when

policyholders are unable to purchase insurance coverage from companies in the voluntary market. In states with significant exposure to catastrophic events, property insurance residual markets may grow to represent a sizable portion of the total insured risk in the exposed regions of the state. In North Carolina, the Beach Plan has become the predominant writer of homeowners insurance in the 18 coastal counties that it covers.

The Beach and FAIR Plans use the premiums collected from policies they issue to fund the losses and expenses attributable to the coverages they insure. When premiums are greater than losses and expenses during a fiscal year, the Beach and FAIR Plans accumulate surplus. That surplus is available to pay losses in the event that future losses and expenses exceed collected premiums plus investment income. However, if the surplus (and any applicable reinsurance) of either the Beach Plan or FAIR Plan is exhausted, then additional losses are passed through to property insurers in North Carolina in the form of an assessment. The potential overall industry assessment from the Beach Plan is limited to \$1 billion per year, but the potential assessment from the FAIR Plan is unlimited. If losses in the Beach Plan exceed its retained surplus, the \$1 billion industry assessment, and any other resources of the Beach Plan (including applicable reinsurance), any additional losses are passed through directly to residential property insurance policyholders in North Carolina in the form of a catastrophe recovery charge of up to 10% of premium per year.

This risk of potential assessments by the Beach Plan and FAIR Plan on property insurers in North Carolina requires that insurance companies be compensated for the additional risk to their capital. To quantify this risk, I have applied a procedure developed by Milliman to incorporate a provision in the mobile homeowners rates that compensates insurers for that assessment risk.

Q. Can you please explain the procedure you applied?

- A. Yes. The methodology developed by Milliman to quantify the compensation for assessment risk involves two steps. The first step is to calculate the magnitude of the exposure itself, and the second step is to determine the fair compensation to be paid to insurers for being required to bear that risk.

To quantify the magnitude of the exposure, it was necessary to estimate the expected value of the assessments on insurers arising from catastrophic losses incurred by the Beach Plan or FAIR Plan. Because an assessment on insurers results only after either the Beach Plan or FAIR Plan has exhausted other resources available to pay losses, I needed to determine the likelihood of that occurring as well as the amount by which the losses exceed those other resources. As such, I obtained information from the Beach and FAIR Plans regarding the reinsurance programs in place for the 2020 storm season, along with assumptions of each plan's accumulated surplus available for the season. The accumulated surplus and available reinsurance represent the "other

resources” that were then available to pay for hurricane losses in anticipation of the 2020 storm season. I then relied on the AIR and RMS hurricane model runs used by the Beach and FAIR Plans for the 2019 storm season, adjusted the estimated losses to the 2020 storm season based on the impact of changes in the underlying exposures and the hurricane models, and evaluated the adjusted losses corresponding to each event simulated by the models. For each adjusted modeled loss, I determined the amount of loss that would be covered by reinsurance and the remaining losses that would be funded either from the plans’ accumulated surplus, through assessments on property insurers in the state, or ultimately through assessments on North Carolina property insurance policyholders. I subtracted the accumulated surplus of the Beach and FAIR Plans from the losses remaining after reinsurance, limited the assessable losses due to Beach Plan exposures to \$1 billion, and calculated the average assessment on property insurers across all events simulated by the models. This average assessment on property insurers is equal to the expected value of the losses that would be funded through assessments on North Carolina property insurers.

As noted above, this calculation produces a measure of the magnitude of the exposure. That is, it represents the risk to insurers’ capital that is associated with the exposure to Beach and FAIR Plans assessments. The second step in Milliman’s analysis is to develop a method of measuring the fair compensation to insurers for bearing this risk.

Q. Can you please explain how you measured the fair compensation for bearing this risk?

A. Yes. To measure the fair compensation for bearing this risk, I relied on publicly-available data that quantifies the market price of catastrophe risk, taken from recently-issued insurance linked securities. Insurance linked securities (ILS) are securities such as bonds, which have conditional payoffs that are very similar to reinsurance. Investors purchase these securities at significant yield premiums compared to risk-free bonds because the investors are exposed to loss of principal and interest if certain “insured events” occur.

Q. What kind of data is available and how is this information used to determine the compensation for assessment risk?

A. Lane Financial, LLC is a firm that specializes in the analysis of insurance linked securities. In March of each year, Lane publishes a table of data that summarizes a variety of information that can be used to evaluate the fair compensation for bearing catastrophe risk. For each ILS in the table, Lane publishes the following data: the yield on the security; the excess return over the risk-free rate; the probability that the security will suffer a loss; and the expected value of loss anticipated on the security. These data elements provide the

foundation for my analysis of the proper compensation for bearing the risk of Beach and FAIR Plans assessments.

Before describing the mechanics of the analysis, I will first define several terms that will prove useful in this discussion.

- The “*yield spread*” is simply the difference between the yield on a particular ILS and the risk-free rate. If a \$100 million bond is issued with a yield spread of 10%, this implies that the insurer issuing the bond would pay \$10 million in interest in excess of the risk-free rate to encourage investors to purchase such a security.
- For this example, now assume that the distribution of hurricane losses is such that, based on the probability and amount of potential hurricane losses, an investor would anticipate having an average loss of \$2 million per year. This amount is identified as the “*expected loss*.”
- Since the investor in this example receives compensation of \$10 million in excess of the risk-free rate for bearing the risk of loss, the “*expected profit*” to the investor is \$8 million (i.e., \$10 million in interest in excess of the risk-free rate minus \$2 million of expected losses).
- Finally, I define a term known as the “*profit multiple*,” which is the ratio of expected profit to expected loss. In the above example, the profit multiple would be \$8 million of expected profit divided by \$2 million of expected loss, or a profit multiple of 4.0.

The profit multiples derived from insurance linked securities provide an estimate of the compensation that investors require to bear catastrophe risk, in that they tell us what investment returns are required in order to take on the risk of loss from a catastrophic event. One particularly important feature of this metric is that it is a measure of compensation per dollar of expected loss. As a result, because the first step of my analysis determines the expected value of losses that would be funded through assessments, the profit multiple can be applied to those expected values to develop an estimate of the fair compensation for bearing such risk. This is the measure of risk I rely upon in evaluating the fair compensation for property insurers whose capital is exposed to Beach and FAIR Plans assessments.

Q. Generally speaking, which insurance linked securities have larger risk premiums and higher profit multiples?

A. For exposures such as catastrophic events, securities that have a lower probability of incurring a loss have greater volatility and as a result, have larger risk premiums. Securities with larger risk premiums have a larger ratio of expected profit to expected loss and, as such, have higher profit multiples.

Q. Have you developed any exhibits that summarize the calculations used to develop the fair compensation to insurers for bearing the risk of Beach Plan or FAIR Plan assessments?

A. Yes. Exhibit RB-5 contains ten pages of information required to develop the fair compensation for bearing Beach and FAIR Plan assessment risk.

- *Page 1* of Exhibit RB-5 shows the curve I fit to the ILS profit multiples based on all catastrophe-related securities issued in the last ten years. This exhibit also includes the equation of the fitted curve, which can be used to determine the average profit multiple for any layer to which insurer capital is exposed.
- *Page 2* shows a summary of the Beach Plan's reinsurance program, and *Page 6* shows a similar summary of the FAIR Plan's reinsurance program. These summaries include the various layers of reinsurance purchased and the coverage levels within those layers.
- *Pages 3 and 7* display the profit multiples calculated for each layer of the Beach and FAIR Plans' loss distributions, based on the equation shown on *Page 1*. In order to determine the fair compensation to voluntary insurers for bearing the risk of assessments, I need to determine which layers contain losses that will be funded by assessments, as well as the corresponding expected losses within those layers. The profit multiples can then be applied to the expected losses to determine the appropriate compensation per dollar of expected loss in each layer.
- *Pages 4 and 8* illustrate how potential losses for the Beach Plan Residential Account and FAIR Plan are funded. (The Beach Plan determines losses and assesses voluntary insurers separately for each account, while the FAIR Plan has only one account.) Because of the \$1 billion limit on Beach Plan assessments, any amounts needed to pay claims in excess of the assessable amounts are to be collected through surcharges on property insurance policyholders statewide.

For each event simulated by the hurricane models, losses are separated by account (Beach Plan Residential, Beach Plan Commercial, FAIR Plan Residential, and FAIR Plan Commercial). Then, the losses for each account are divided into layers based on the source of funding for those losses – Beach Plan or FAIR Plan surplus, assessments on voluntary insurers, private reinsurance, and ultimately any additional amounts in the Beach Plan to be covered by policyholder surcharges. Finally, the losses associated with each event are accumulated in each of the loss layers to determine expected values.

- Although *Pages 4 and 8* illustrate the funding of potential losses within each layer, the purpose of my analysis is to determine the fair compensation for the

risk of assessments on private insurers. As such, the analysis must take into account the probability of losses occurring within each layer and the expected value of losses that will be borne by private insurers. *Pages 5 and 9* of Exhibit RB-5 provide that analysis. They show the expected value of the losses that would be covered by the Beach Plan Residential and FAIR Plan Residential accounts, and the average annual amount of those losses that would be assessed to private insurers. Pages 5 and 9 also display the average profit multiples associated with each layer of the loss distribution, and the product of the indicated profit multiples times the expected losses within each layer. The sum of those values is the indicated compensation for assessment risk for each account.

- The final step in my calculation is to determine the appropriate provision to be included in the mobile homeowners rates to compensate insurers for the risk of Beach Plan or FAIR Plan assessments. This provision, expressed as a percent of premium, is developed on *Page 10* of Exhibit RB-5. Since assessments for Beach Plan or FAIR Plan losses are applied to all property insurance lines in the state, the bottom table on Exhibit RB-5, Page 10 shows the development of a charge that will produce an amount of revenue equal to the total required compensation of \$103.59 million. As shown on this exhibit, that charge amounts to 2.9% of total property insurance premium in the state.

Q. How is the 2.9% provision developed in Exhibit RB-5 used to develop the *compensation for assessment risk per policy* in row 4 of Section C, page 1?

A. After determining the provision for the compensation for assessment risk, it is converted from a percent of premium to a dollar amount per policy on page 75 of Section C. The 2.9% provision is adjusted for variable expenses by dividing by 79.0%, where 79.0% is equal to 100% minus the variable expense ratio (i.e., 17.9% commission and brokerage plus 3.1% taxes, licenses, and fees). The resulting calculated percentage (i.e., $2.9\% / 79.0\% = 3.7\%$) is multiplied by the current average base rate for each MH(C) coverage to determine the *compensation for assessment risk per policy*. This dollar charge per policy for each MH(C) coverage represents an amount that, when collected, is sufficient to cover the variable expenses attributable to each dollar of premium collected, as well as an adequate amount to compensate the insurer for the potential risk of assessment by the Beach Plan or FAIR Plan. Because assessments from the Beach Plan and FAIR Plan only apply to property lines of insurance, a provision for the compensation for assessment risk is not included in the calculation of the MH(C) Liability indicated rate change.

Q. In your opinion, is it appropriate to include a 2.9% provision for the compensation for assessment risk in mobile homeowners rates in North Carolina?

A. Yes. Insurance companies writing mobile homeowners policies in North Carolina are exposed to the risk of Beach Plan or FAIR Plan assessments as a result of writing voluntary market property insurance in the state. As such, those insurance companies are entitled to receive fair compensation for bearing that risk and it is appropriate to include that compensation in the mobile homeowners rates. The model Milliman has developed relies on a widely-accepted measure of compensation to determine a provision that will fairly compensate insurers for bearing this additional risk to their capital.

Q. What is the source of the amounts shown in row 5 of Section C, page 1, labeled as the *net cost of reinsurance per policy*?

A. The source of the net cost of reinsurance for each MH(C) coverage is an analysis completed for the Rate Bureau by Aon. It is my understanding that Aon was retained by the Rate Bureau based on their ability to access relevant data and experience from the reinsurance market, their expertise with catastrophe-related issues, and their prominence with respect to the reinsurance industry. This is consistent with other recent property rate filings submitted by the Rate Bureau.

In Aon's analysis, they use their experience and expertise as a reinsurance broker to develop layers of reinsurance coverage that are representative of typical amounts of reinsurance coverage purchased by the property insurance industry. Using data, catastrophe models, and other information available to Aon, they estimated the reinsurance premium associated with each layer of coverage, determined the expected losses within each layer, and calculated the net cost of reinsurance as the difference between the reinsurance premium and the expected losses in each layer. These premium amounts, losses, and net costs of reinsurance were developed separately by peril and by territory for each MH(C) coverage so that they could be summarized appropriately to develop a statewide or territory indicated rate change. More details of Aon's analysis are included in Ms. Mao's and Mr. Fiete's testimony and exhibits.

To determine the *net cost of reinsurance per policy* found in row 5 of Section C, page 1, the total reinsurance cost for each MH(C) coverage is first divided by the corresponding number of 2019 earned house years. The resulting average reinsurance cost is further adjusted by dividing by the 2019 average rating factor, the 2019 premium trend factor, and the expected loss and fixed expense ratio. These calculations can be found on pages 76, 77, and 78 of Section C for Mobile Home Structures, Adjacent Structures, and Personal Effects, respectively. These supporting pages show the development of the statewide net cost of reinsurance per policy as well as the net cost of reinsurance for each territory group. Similar to the compensation for assessment risk, the net cost of reinsurance per policy is not included in the calculation of the MH(C) Liability indicated rate change.

Q. Can you please explain why a provision for the net cost of reinsurance per policy is necessary in this filing?

A. Yes. Mobile homeowners insurance is one of several types of coverages that has exposure to potential catastrophic events. In such coverages (mobile homeowners, homeowners, and other property coverages), individual catastrophic events can result in significant losses that exceed the amount of liability the typical insurer can reasonably assume for solvency and financial stability considerations. As a result, in these lines of business, insurers routinely purchase reinsurance to mitigate their exposure to extreme events. In order to accurately reflect the expected costs associated with insuring property policies, it is appropriate to include the cost of this reinsurance in the ratemaking process for these lines of insurance.

Q. In your opinion, is it appropriate to include a provision for the net cost of reinsurance per policy in mobile homeowners rates in North Carolina?

A. Yes. Insurance companies writing mobile homeowners policies in North Carolina incur a significant cost for bearing the risk of insuring properties exposed to catastrophic events. Regardless of whether the risk of catastrophic losses is retained by the primary insurer or transferred to a reinsurer, the market cost of bearing that risk must be included in the rates. This is a foundational actuarial principle included in ASOP No. 29 regarding *Expense Provisions in Property/Casualty Insurance Ratemaking* and is a legitimate cost of the risk transfer inherent in the purchase of property insurance. As such, the net cost of reinsurance per policy should be included in the North Carolina mobile homeowners rates.

Q. In your opinion, is it appropriate to allocate reinsurance costs within North Carolina in a way that is proportional to risk?

A. Yes. The risk associated with insuring properties exposed to catastrophic events varies geographically within North Carolina. As such, the cost for bearing that risk should be allocated proportional to the measurement of risk. In their analysis of reinsurance costs for this filing, Aon provided the statewide provision for the net cost of reinsurance per policy and, as mentioned above, also allocated the reinsurance costs to each MH(C) coverage and each territory. This allocation is appropriate and consistent with the objective of producing rates that are fair, reasonable, and not unfairly discriminatory across policyholders.

Q. Please explain the amounts shown in row 6 of Section C, page 1, identified as the *indicated manual base rate*.

A. The dollar amounts shown in row 6 are the sum of the base rate excluding reinsurance cost (row 3), the compensation for assessment risk per policy (row 4), and the net cost of reinsurance per policy (row 5) for each coverage. These

amounts represent the average base rate for each MH(C) coverage after reflecting reasonable provisions for all expected losses, expenses, profit, and contingencies quantified in this filing. If insurance companies did not deviate from the manual premiums, the *indicated manual base rate* would represent the appropriate, actuarially sound base rate for each coverage.

Q. What is the source of the percentages shown in row 7 of Section C, page 1, labeled as *net deviations*?

A. As included in the prior mobile homeowners MH(C) rate filing, the Rate Bureau has selected a provision for *net deviations* of 5%. In making this selection, we evaluated historical written premium and manual premium for each year from 2015 through 2019, and we considered the magnitude of both downward deviations and upward surcharges through consent to rate. The data supporting this analysis can be found on page 79 of Section C. In an attempt to be conservative and to be consistent with the prior mobile homeowners MH(C) filing, the Rate Bureau maintained the same selected provision for net deviations of 5%.

Q. In your opinion, is it appropriate to include a provision for net deviations in mobile homeowners rates in North Carolina?

A. Yes. The difference between the direct premium written by insurance companies and the manual premium should be considered when determining the actuarially sound indicated manual premium. The manual premium must be adjusted upward such that the deviated premium charged by insurance companies will be adequate. In my opinion, the selected provision for net deviations of 5% is a conservative estimate that only partially recognizes the significant deviations we expect to be applied by mobile homeowners insurance companies.

Q. Please explain the amounts shown in row 8 of Section C, page 1, identified as the *required base rate*.

A. The dollar amounts shown in row 8 are the indicated manual base rate for each coverage (row 6) adjusted for the net deviations (row 7). As mentioned above, if insurance companies were not anticipated to deviate from the manual premiums, the indicated manual base rate for each coverage (row 6) would be adequate and appropriate. However, because historical experience shows that mobile homeowners insurance companies consistently deviate by significant amounts each year, the indicated manual base rate for each coverage is divided by 100% minus the provision for net deviations to determine the *required base rate*. The *required base rate* for each coverage represents the appropriate base rate such that, if insurance companies apply net deviations of 5%, the charged premiums will be sufficient to cover all expected costs associated with the transfer of risk related to mobile homeowners insurance.

Q. Would you explain the amounts shown in row 9 of Section C, page 1, labeled as the *average current base rate*?

A. Row 9 displays the current base rate for each coverage, averaged across all policies from 2019 included in our analysis. The average statewide base rate for each coverage assumes each policyholder purchases the base coverage and has the same characteristics as the base risk.

Q. Please explain row 10 of Section C, page 1, identified as the *indicated rate change*.

A. The percentages shown in row 10 represent the needed changes to the current base rate for each coverage so that the mobile homeowners rates will be adequate for the cost levels expected to prevail in the one year period following the effective date of this filing. The *indicated rate change* is calculated as the required base rate (row 8) divided by the current average base rate (row 9) minus 1. The resulting indicated rate change for each coverage is as follows:

- Mobile Home Structures = 26.9%
- Adjacent Structures = 39.2%
- Personal Effects = -6.8%
- Liability = 11.8%

The overall indicated rate change across all MH(C) coverages, as summarized on page 1 of Section A, is 22.3%.

Q. Would you explain the percentages shown in row 11 of Section C, page 1, labeled as the *proposed rate change*?

A. Due to the wide range of indicated rate changes across the territory groups and MH(C) coverages, the Rate Bureau's Governing Committee decided to cap rate changes in order to mitigate the effect of large rate swings on policyholders, while still moving in the direction of the indicated rate changes. The resulting proposed rate change for each coverage is as follows:

- Mobile Home Structures = 13.0%
- Adjacent Structures = 16.2%
- Personal Effects = 0.0%
- Liability = 11.8%

The overall proposed rate change across all MH(C) coverages, as summarized on page 1 of Section A, is 11.3%.

Q. What is the difference between the indicated rate change and the proposed rate change?

- A. The indicated rate change is the actuarially sound and correct rate at a statewide level or by territory group for each mobile homeowners MH(C) coverage. It is the indicated rate change (statewide or by territory group) that is needed to sufficiently cover the expected losses and expenses while still providing a fair and reasonable profit. The indicated rate is also the rate that complies with the statutory requirement that rates not be excessive, inadequate, or unfairly discriminatory.

In order to mitigate the impact of these indicated rate changes on policyholders, the Rate Bureau has proposed rates that reflect a cap on the changes by territory group for each MH(C) property coverage. The cap applied to each territory group within each MH(C) property coverage depends on the magnitude of the indicated rate change. This capping lowers the overall statewide rate change to 11.3% from the indicated statewide rate change of 22.3%.

In my opinion, the Rate Bureau's territory group caps for each MH(C) property coverage are reasonable and are an effective strategy to mitigate the impact of this filing on policyholders in those territory groups with the highest indicated rate changes. However, for those territory groups that are limited by the cap (i.e., their indicated rate changes are higher than their proposed changes), it should be noted that the proposed rates in those territory groups will continue to be inadequate.

- Q. Please explain row 12 of Section C, page 1, identified as the *proposed base rate*.**

- A. The dollar amounts shown in row 12 represent the *proposed base rate* for each coverage, averaged across all policies from 2019 included in our analysis. Similar to the average current base rate, the average statewide proposed base rate for each coverage assumes each policyholder purchases the base coverage and has the same characteristics as the base risk. The proposed base rate for each coverage was calculated as the average current base rate (row 9) multiplied by 1 plus the proposed rate change (row 11).

- Q. In an earlier question discussing the *total base class loss cost* found in row 1 of Section C, page 1, your response made reference to Section C, pages 2, 4, 6, and 8. Looking at Section C, page 2, what is shown on this exhibit?**

- A. Section C, page 2 shows the determination of the statewide base class loss cost for Mobile Home Structures coverage. More specifically, this exhibit aggregates non-hurricane losses and loss adjustment expenses for the years 2015 through 2019 and combines these amounts with a modeled hurricane loss cost to develop the total base class loss cost. The specific calculations used to aggregate the non-hurricane and hurricane loss experience will be discussed later. Pages 4, 6, and 8 show similar calculations for the other MH(C) coverages: Adjacent Structures, Personal Effects, and Liability.

- Q. Referring to column 1 on page 2 of Section C, what is the source for the *non-hurricane ultimate loss and LAE* (loss adjustment expense)?**
- A. The *non-hurricane ultimate loss and LAE* shown in column 1 is developed on page 3 of Section C for each year from 2015 through 2019. As implied by the column label, the amounts in column 1 have been developed to ultimate and adjusted to include a provision for expected loss adjustment expenses. Those calculations, as well as adjustments to include expected rather than actual excess wind losses and expected rather than actual flood losses, can be found in more detail on page 3 of Section C.
- Q. If we turn our attention to Section C, page 3, what is shown on this exhibit?**
- A. As mentioned in the prior response, Section C, page 3 shows the determination of the *non-hurricane ultimate loss and LAE* for Mobile Home Structures coverage. Column 1 on this exhibit contains incurred loss and ALAE for the years 2015 through 2019 from all causes of loss except those losses caused by hurricanes. As noted previously, the mobile homeowners MH(C) policy includes coverage for flood losses, so any flood losses other than storm surge resulting from a hurricane would be included in the historical loss experience (though such losses may be limited by the excess flood procedure).
- Q. Please explain columns 2 and 4 of Section C, page 3, which both contain data related to excess wind losses.**
- A. The incurred loss and ALAE in column 1 reflect all non-hurricane losses, including actual wind losses that may have resulted from very severe storms such as tornados, thunderstorms, or hailstorms. In order to smooth out any potential volatility of severe non-hurricane wind losses, we used the same excess wind methodology as used in prior Rate Bureau property filings. The calculations supporting this excess wind methodology can be found on pages 43 and 44 of Section C. Based on the results of the excess wind methodology, a portion of the wind loss and ALAE included in Column 1 are determined to be excess wind loss and ALAE and are removed from the historical loss experience for the purpose of calculating a reasonable provision for expected non-hurricane losses. Column 2 shows the amount of excess wind loss and ALAE incurred under the Mobile Home Structures coverage that are being removed from the incurred loss and ALAE in column 1. In place of the actual excess wind loss and ALAE in column 2, an excess wind loss factor is applied to each year of experience, as shown in column 4. By applying an excess wind loss factor, the Rate Bureau is able to smooth out potentially volatile historical loss experience and reflect a consistent provision for long-term excess wind loss and ALAE.
- Q. Please describe the excess wind methodology found on pages 43 and 44 of Section C in more detail.**

- A. The excess wind methodology used in this filing and in prior Rate Bureau property filings relies on a longer history of loss experience than the five years used to support most of the other components of this filing. Although the mobile homeowners excess wind loss experience is not as extensive as in homeowners, the Rate Bureau was able to aggregate 16 years of mobile homeowners non-hurricane losses for this filing in order to evaluate excess wind losses. Page 43 of Section C shows non-hurricane losses by year from 2004 through 2019. Among the non-hurricane (and non-liability) losses, the wind losses and flood losses are shown separately from the total non-hurricane losses excluding wind and flood. The ratio of wind losses to total non-hurricane losses excluding wind and flood is calculated for each year and, based on calculations consistent with prior Rate Bureau property filings, the amount of non-hurricane excess wind losses are determined for each year. In addition to determining the excess wind losses by year, the yearly ratios of wind losses to total non-hurricane losses excluding wind and flood are used to calculate an excess wind loss factor of 1.072. This excess wind loss factor represents the provision needed to incorporate the long-term average excess wind losses in the adjusted non-hurricane loss experience.

The excess wind losses determined with this methodology reflect all MH(C) coverages combined. As a result, the total MH(C) excess wind losses are allocated by coverage for each year based on the distribution of incurred non-hurricane wind losses among the coverages within each year. In addition to allocating the excess wind losses, a non-hurricane ALAE factor is calculated for each year based on the ratio of total non-hurricane (and non-liability) loss and ALAE to total non-hurricane (and non-liability) losses. The resulting non-hurricane ALAE factors are applied to the by-coverage excess wind losses within each year to determine the excess wind loss and ALAE by coverage. That allocation process and application of a non-hurricane ALAE factor can be seen on page 44 of Section C.

- Q. Please explain columns 3 and 5 of Section C, page 3, which both contain data related to excess flood losses.**
- A. As mentioned earlier in my testimony, a non-hurricane excess flood methodology is being introduced in this filing that is similar to the excess wind methodology. The incurred loss and ALAE in column 1 reflect all non-hurricane losses, including actual flood losses that may have resulted from severe thunderstorms, heavy rainfalls, or extensive snow runoff. In order to smooth out any potential volatility of severe non-hurricane flood losses, we used the same excess flood methodology as described above related to excess wind losses. The calculations supporting this excess flood methodology can be found on pages 45 and 46 of Section C. Based on the results of the excess flood methodology, a portion of the flood loss and ALAE included in Column 1 are determined to be excess flood loss and ALAE and are removed from the historical loss experience

for the purpose of calculating a reasonable provision for expected non-hurricane losses. Column 3 shows the amount of excess flood loss and ALAE incurred under the Mobile Home Structures coverage that are being removed from the incurred loss and ALAE in column 1. In place of the actual excess flood loss and ALAE in column 3, an excess flood loss factor is applied to each year of experience, as shown in column 5. By applying an excess flood loss factor, the Rate Bureau is able to smooth out potentially volatile historical loss experience and reflect a consistent provision for long-term excess flood loss and ALAE.

Q. Please describe the excess flood methodology found on pages 45 and 46 of Section C in more detail.

- A. The excess flood methodology being introduced in this filing relies on a longer history of loss experience than the five years used to support most of the other components of this filing. Like the excess wind methodology described above, the Rate Bureau was able to aggregate 16 years of mobile homeowners non-hurricane losses for this filing in order to evaluate excess flood losses. Page 45 of Section C shows non-hurricane losses by year from 2004 through 2019. Among the non-hurricane (and non-liability) losses, the wind losses and flood losses are shown separately from the total non-hurricane losses excluding wind and flood. The ratio of flood losses to total non-hurricane losses excluding wind and flood is calculated for each year and, based on calculations consistent with the excess wind methodology, the amount of non-hurricane excess flood losses are determined for each year. In addition to determining the excess flood losses by year, the yearly ratios of flood losses to total non-hurricane losses excluding wind and flood are used to calculate an excess flood loss factor of 1.029. This excess flood loss factor represents the provision needed to incorporate the long-term average excess flood losses in the adjusted non-hurricane loss experience.

The excess flood losses determined with this methodology reflect all MH(C) coverages combined. As a result, the total MH(C) excess flood losses are allocated by coverage for each year based on the distribution of incurred non-hurricane flood losses among the coverages within each year. In addition to allocating the excess flood losses, a non-hurricane ALAE factor is calculated for each year based on the ratio of total non-hurricane (and non-liability) loss and ALAE to total non-hurricane (and non-liability) losses. The resulting non-hurricane ALAE factors are applied to the by-coverage excess flood losses within each year to determine the excess flood loss and ALAE by coverage. That allocation process and application of a non-hurricane ALAE factor can be seen on page 46 of Section C.

Q. How are the results of the excess wind methodology and excess flood methodology applied to the Mobile Home Structures loss experience on page 3 of Section C?

A. Based on the wind and flood allocation processes described above, column 2 on page 3 of Section C shows the amount of excess wind loss and ALAE allocated to the Mobile Home Structures coverage for each year, and column 4 shows the amount of excess flood loss and ALAE allocated for each year. In addition, the excess wind loss factor is shown in column 4 and the excess flood loss factor is shown in column 5. Column 6 on this exhibit adjusts the non-hurricane incurred loss and ALAE in column 1 by removing the excess wind loss and ALAE (column 2) and excess flood loss and ALAE (column 3) and multiplying the result by the sum of the excess wind loss factor (column 4) and excess flood factor (column 5) minus 1.00. This calculation produces the *adjusted non-hurricane incurred loss and ALAE* for each year.

Q. Is the adjusted non-hurricane incurred loss and ALAE shown in column 6 adjusted in any other way?

A. Yes. After adjusting for excess wind loss and ALAE and excess flood loss and ALAE, the amounts in column 6 are further adjusted for loss development and to include a provision for expected unallocated loss adjustment expenses (ULAE).

Based on data collected in response to the Rate Bureau's mobile homeowners data call, we evaluated historical loss development data and historical claim development data for each mobile homeowners MH(C) coverage. Details of that analysis can be found on pages 47 through 54 of Section C, and the resulting loss and ALAE development factors are included in column 7 on page 3 of Section C. Column 8 on this same exhibit calculates the *non-hurricane ultimate loss and ALAE* for each year by multiplying the adjusted non-hurricane incurred loss and ALAE (column 6) by the corresponding loss and ALAE development factor (column 7).

In addition to evaluating historical loss and ALAE development data, we also compared the ratio of incurred ULAE to incurred loss and ALAE for each of the five years of experience used in the overall rate indications. This analysis of historical ULAE can be found on page 73 of Section C. Based on the average ratio of incurred ULAE to incurred loss and ALAE, the Rate Bureau selected a ULAE provision of 9.0%. Through the use of a ULAE factor equal to 1.090, the selected ULAE provision is added to non-catastrophe mobile homeowners loss and ALAE evaluated in the rate indications.

Referring back to page 3 of Section C, column 10 calculates the *non-hurricane ultimate loss and LAE* for each year by multiplying the non-hurricane ultimate loss and ALAE (column 8) by the ULAE factor, which is shown in column 9.

Q. In your opinion, is the provision for unallocated loss adjustment expense included in this filing reasonable?

- A. Yes, the unallocated loss adjustment expense provision is reasonable. It is common practice in the industry to use an average of historical experience to determine an unallocated loss adjustment expense provision.
- Q. Are the non-hurricane ultimate loss and LAE amounts on page 3 of Section C the same as the amounts shown on page 2 of Section C?**
- A. Yes. After determining the non-hurricane ultimate loss and LAE on page 3 of Section C, those amounts are copied on page 2 so that additional adjustments and calculations can be completed.
- Q. What other adjustments must be made to the non-hurricane losses and LAE?**
- A. The losses need to be adjusted by a loss trend factor to reflect the cost levels expected to prevail during the period that the proposed rates are anticipated to be in effect. For this filing, the assumed effective date is November 1, 2021. If the filing were to become effective on a date later than the November 1, 2021 assumed effective date, then the rate indications would be different than those presented in this filing.
- Q. Please describe how the loss trend factors are developed and applied.**
- A. Loss trend data was evaluated separately for each MH(C) coverage in an analysis on pages 55 through 61 of Section C. For each property coverage, only industry data was considered, but for liability coverage, both industry data and external cost index data were considered.
- The industry data included quarterly ultimate claim frequencies and quarterly ultimate loss severities evaluated on a 12-month moving basis from the 4th quarter of 2014 to the 4th quarter of 2019. The reported claims and incurred loss and ALAE were developed to ultimate using interpolated quarterly development factors found on page 61 of Section C. The external cost index data that was considered for liability coverage included quarterly index values of the medical care component of the Consumer Price Index (CPI).
- After compiling the industry-based frequencies and severities and the external cost index (only for liability coverage), several different exponential trends were fit to the data in order to evaluate the historical trends and to project potential future trends. Because the current loss trend analysis primarily relied upon industry data and not on external cost indices, we did not apply a first dollar of loss adjustment that is typically used in other Rate Bureau property filings.
- The Rate Bureau reviewed the exponential trends fit to the industry data as well as the exponential trends fit to the external cost index that was considered for liability coverage. Based on the fitted trends, the Rate Bureau selected

frequency and severity trends for two separate time periods. Trends were selected for the historical experience period and separate trends were selected for the projection period. This two-period trend approach is commonly used throughout the industry because it allows companies to reflect the latest changes in trends as historical experience is projected into the future.

The experience period trends were applied to adjust losses from the midpoint of each historical year to the end date of the most recent experience period (i.e., 12/31/2019). Following this, the projection period trends were applied from the end date of the most recent experience period (i.e., 12/31/2019) to the average accident date for the time period that the proposed rates are anticipated to be in effect (i.e., 11/1/2022). The selected experience period loss trends and projection period loss trends were each applied for the appropriate number of years and the combined effect of these trends was calculated to determine loss trend factors for each year in the historical experience period. The calculation of the loss trend factors for the MH(C) property coverages can be found on page 55 of Section C and the calculation of the MH(C) Liability loss trend factors can be found on page 56 of Section C.

Q. After loss trend factors are applied, what other adjustments are made to the non-hurricane ultimate loss and LAE amounts?

A. The calculated loss trend factors discussed above can be found in column 2 on page 2 of Section C. In column 5 on the same exhibit, the *trended average loss cost* is calculated for each year based on multiplying the non-hurricane ultimate loss and LAE (column 1) by the loss trend factor (column 2) and dividing by the earned house years (column 3) and the premium trend factor (column 4). The losses need to be offset (i.e., adjusted downward) by a premium trend factor to reflect the fact that higher cost levels are partially the result of higher amounts of coverage being purchased in each subsequent year. These higher amounts of coverage generally correspond to higher average premiums, and the trend in those higher average premiums should be reflected to mitigate the impact of the loss trend factors.

Q. Please describe how the premium trend factors are developed and applied.

A. Premium trend data was evaluated separately for each mobile homeowners MH(C) coverage in an analysis on pages 64 through 66 of Section C.

For each of the property coverages, we calculated the average rating factor by year. The average rating factors were calculated as the ratio of the earned premium at current manual level (using each policy's rating characteristics) to the earned premium at current base class level. The earned premium calculations were completed using the extension of exposures method, as described in Section E. For liability coverage, we calculated the average rating factor by year to be equal to the average increased limit factor. The calculation of the liability

average rating factors can be found on page 66 of Section C. After compiling the average rating factors by year, several different exponential trends were fit to the data in order to evaluate the historical trends and to project potential future trends.

The Rate Bureau reviewed the exponential trends fit to the average rating factors and selected trends for two separate time periods. Similar to the loss trend analysis, premium trends were selected for the historical experience period and separate trends were selected for the projection period. As mentioned previously, this two-period trend approach is commonly used throughout the industry because it allows companies to reflect the latest changes in trends as historical experience is projected into the future.

The experience period trends were applied to adjust premiums from the average written date of each historical year to the end date of the most recent experience period (i.e., 12/31/2019). Following this, the projection period trends were applied from the end date of the most recent experience period (i.e., 12/31/2019) to the average written date for the time period that the proposed rates are anticipated to be in effect (i.e., 5/1/2022). The selected experience period premium trends and projection period premium trends were each applied for the appropriate number of years and the combined effect of these trends was calculated to determine premium trend factors for each year.

Q. After premium trend factors are applied, are the trended average loss costs shown in column 5 on page 2 of Section C adjusted in any other way?

A. Yes. The trended average loss costs in column 5 are divided by the average rating factor for each year (column 6) to determine the *trended base class loss cost* as shown in column 7. The average rating factor for each year is calculated as the ratio of the average premium at current manual level to the average current base rate. This ratio represents the relative difference in premium between the average mobile homeowners policy and the base class. To the extent the average policyholder purchases different amounts of coverage, different deductibles, or resides in a different territory group than the base class, the average rating factor will reflect these differences. The average rating factors by year in column 6 are the same factors as were used to develop the premium trends on page 65 of Section C.

Q. Please explain how the trended base class loss costs in column 7 on page 2 of Section C are used after they are calculated for each year in the experience period.

A. The trended base class loss costs shown in column 7 are aggregated using the accident year weights in column 8 to determine the *weighted average non-hurricane base class loss cost* (row 9).

The credibility of the weighted average non-hurricane base class loss cost is evaluated for each MH(C) coverage based on coverage-specific full-credibility standards. To the extent the weighted average non-hurricane base class loss cost is not fully credible, the complement of credibility is determined based on loss cost estimates from the prior MH(C) rate filing and updated trends from this filing. More specifically, the credibility-weighted loss cost from the prior filing is trended to the proposed effective date of this filing using the selected loss trend and premium trend for the projection period in order to calculate the complement of credibility. The calculation of the complement of credibility for each MH(C) coverage can be found on page 68 of Section C. Using the weighted average non-hurricane base class loss cost (row 9), the credibility of that loss cost (row 10), and the complement of credibility (row 11), the *credibility-weighted loss cost* is calculated as shown in row 12.

Q. How is credibility determined in this filing?

A. The credibility calculated in row 10 on page 2 of Section C is based on a consistent claims standard for full credibility (i.e., 271 claims) for each of the MH(C) coverages. However, that claims standard for full credibility is adjusted based on the frequency of claims for each coverage and the variability of the size of those claims. More details on this credibility procedure can be found in the Explanatory Memorandum included in Exhibit RB-1. The result of this adjustment for claims frequency and variability is a full-credibility standard using earned house years that is unique to each coverage. The resulting full-credibility standards for each of the MH(C) coverages, rounded up to the nearest 10,000 earned house years, are as follows:

- Mobile Home Structures = 30,000
- Adjacent Structures = 90,000
- Personal Effects = 90,000
- Liability = 1,620,000

To determine the credibility shown in row 10, the number of earned house years during the five year experience period is compared to the coverage's full-credibility standard and, if a coverage's historical experience is not fully credible, the square root rule is applied. Among the MH(C) coverages, only the Liability weighted average base class loss cost is not fully credible, with a credibility of 50.5%.

The above full-credibility standards for the MH(C) coverages are also applied in determining the indicated base class loss cost by territory group, which is discussed later in this testimony.

Q. Please explain the amount shown in row 13 on page 2 of Section C, labeled as the *modeled hurricane base class loss cost*.

A. The amount shown in row 13 is the provision for prospective hurricane losses related to the coverage afforded by the MH(C) Mobile Home Structures coverage. The credibility-weighted loss cost shown in row 12 includes only non-hurricane losses, so an additional provision is necessary to account for the exposure to hurricane losses on a mobile homeowners policy.

Q. What is the source of the *modeled hurricane base class loss cost* shown in row 13 of Section C, page 2?

A. The source of the modeled hurricane losses for each MH(C) coverage is an analysis completed for the Rate Bureau by Aon. In addition to Aon's analysis to support the net cost of reinsurance per policy (described previously), Aon was also retained by the Rate Bureau to provide the statewide modeled hurricane losses for each of the MH(C) coverages as well as modeled hurricane losses for each territory. It should be noted that the modeled hurricane losses for Mobile Home Structures coverage include modeled hurricane losses attributable to Additional Living Expense (ALE) coverage since ALE coverage is automatically included when a policyholder purchases Mobile Home Structures coverage. This analysis from Aon is consistent with other recent property rate filings submitted by the Rate Bureau, except that the models were run with storm surge losses to reflect the fact that the mobile homeowners MH(C) policy covers flood losses. It is for this reason, as noted earlier, that when the filing and my testimony refer to "hurricane losses," that term means hurricane wind and storm surge losses, but not inland flood losses. In order to avoid double counting hurricane losses, historical hurricane wind and hurricane storm surge losses in the data underlying our analysis were removed. More details of Aon's analysis, including support for the catastrophe LAE provision of 6.0%, are included in Ms. Mao's and Mr. Fiete's testimony and exhibits.

To determine the *modeled hurricane base class loss cost* found in row 13 of Section C, page 2, the trended modeled hurricane loss and LAE for each MH(C) property coverage is divided by the corresponding number of 2019 earned house years, the 2019 average rating factor, and the 2019 premium trend factor. These calculations can be found on page 69 of Section C for each of the MH(C) property coverages.

Similar to the compensation for assessment risk and the net cost of reinsurance per policy, a modeled hurricane base class loss cost is not included in the calculation of the MH(C) Liability indicated rate change.

Q. Can you please explain why hurricane models are used to estimate the hurricane losses?

A. Yes. Hurricane models are used to estimate the expected hurricane losses because they provide a more accurate way of quantifying the exposure to hurricanes than using prior insurance ratemaking methodologies. In addition,

hurricane models include a storm surge component, which allows us to more accurately quantify the expected losses from storm surge caused by hurricanes as well as the expected hurricane wind losses. Hurricanes are highly variable in their frequency, severity, and place of occurrence. By simulating thousands of possible hurricane events, hurricane models provide a more complete perspective on the distribution of the types of hurricanes that could occur and avoid the volatility that could result from using actual hurricane losses. If only five years of historical experience were used to evaluate hurricane losses, similar to what we are using for the non-hurricane component of this rate indication, it would be feasible to have a five year period with no hurricane losses or a five year period with multiple severe hurricane events. Neither of those scenarios provides a reasonable representation of the expected exposure to hurricane losses in the prospective policy period and, as such, it would not be actuarially appropriate to rely on such a methodology. The use of hurricane models alleviates this issue and provides a more accurate estimate of expected hurricane losses.

Q. What data did Milliman provide to Aon to enable Aon to perform its analysis?

A. Milliman provided Aon with a dataset containing all of the North Carolina mobile homeowners MH(C) insurance exposures. This data included the number of earned house years and the amount of earned insurance years for the most recent year in the experience period (i.e., 2019). The dataset also included several important risk characteristics such as the territory (and county and city, if available), occupancy code, MH(C) coverage, and whether the mobile home is tied down. Milliman also provided exposure trend information to Aon for Aon's use in trending the mobile homeowners MH(C) exposures that would be used as inputs in the hurricane models. The data provided to Aon by Milliman was correct to the best of my knowledge and information.

Q. Please describe how the exposure trend factors are developed.

A. Exposure trend data was evaluated separately for each of the property coverages in an analysis on pages 62 and 63 of Section C.

For each of the property coverages, we calculated the average amount of insurance per policy on a 12-month moving basis from the 1st quarter of 2014 to the 4th quarter of 2019. After compiling the average amount of insurance by quarter, several different exponential trends were fit to the data in order to evaluate the historical trends and to project potential future trends.

The Rate Bureau reviewed the exponential trends fit to the average amounts of insurance and selected trends for two separate time periods. Similar to the loss trend and premium trend analyses, exposure trends were selected for the historical experience period and separate trends were selected for the projection

period. Again, this two-period trend approach is commonly used throughout the industry since it allows companies to reflect the latest changes in trends as historical experience is projected into the future.

The experience period trends were applied to adjust exposures from the average written date of each historical year to the end date of the most recent experience period (i.e., 12/31/2019). Following this, the projection period trends were applied from the end date of the most recent experience period (i.e., 12/31/2019) to the average written date for the time period that the proposed rates are anticipated to be in effect (i.e., 5/1/2022). The selected experience period exposure trends and projection period exposure trends were each applied for the appropriate number of years and the combined effect of these trends was calculated to determine exposure trend factors for each year. The exposure trend rates and exposure trend factors were given to Aon for Aon's use in trending the modeled hurricane losses.

Q. What model versions and modeling assumptions were used to develop estimated hurricane losses?

A. The current AIR model is Touchstone v7.3 and the current RMS model is RiskLink v18.1. To develop the expected hurricane losses, Aon relied on AIR's Standard event set and on RMS' Historical event set. These event sets were used instead of AIR's Warm Sea-Surface Temperature (WSST) event set and RMS' Medium-Term Rate event set. Although many primary insurance companies consider the WSST and Medium-Term Rate events sets when developing expected hurricane losses for indicated rates in states other than North Carolina, the event sets selected for this filing are reasonable and actuarially sound.

Both the AIR and RMS models were run with aggregate demand surge included, which was identified as loss amplification in the RMS model. This standard procedure accounts for the expected additional costs for labor, materials, and services after a very large hurricane occurs. Historical experience shows that, when major catastrophic events occur, the increased demand for building materials, labor, temporary housing, and other basic necessities can exceed the supply of these same items, which consequently increases their cost. Running models with demand surge is consistent with the Rate Bureau's prior filings, and is the common practice by insurance companies when developing rates based on modeled hurricane losses.

As discussed previously, the modeled hurricane losses also include losses from storm surge due to the fact that the mobile homeowners MH(C) policy includes coverage for flood losses.

Q. Were any other calculations applied to the hurricane losses derived from the models?

A. Yes. Before providing the blended hurricane losses, Aon applied a hurricane-specific provision for loss adjustment expense. As noted previously, more details of Aon's analysis, including support for the catastrophe LAE provision of 6.0%, are included in Ms. Mao's and Mr. Fiete's testimony and exhibits.

Q. In your opinion, is it appropriate to allocate modeled hurricane losses within North Carolina in a way that is proportional to risk?

A. Yes. The risk associated with insuring properties exposed to hurricane events varies geographically within North Carolina. As such, the cost for bearing that risk should be allocated proportional to the measurement of risk. In their analysis of modeled hurricane losses for this filing, Aon provided the statewide modeled hurricane losses and also allocated the modeled hurricane losses to each MH(C) coverage and each territory. This allocation is appropriate and consistent with the objective of producing rates that are fair, reasonable, and not unfairly discriminatory across policyholders.

Q. Please explain the amount shown in row 14 on page 2 of Section C, labeled as the *total base class loss cost*.

A. The amount shown in row 14, that is the *total base class loss cost*, is the average amount of projected loss per exposure, including both non-hurricane and hurricane losses, for the risk identified as the base class for each respective MH(C) coverage. It is calculated as the sum of the credibility-weighted loss cost shown in row 12 and the modeled hurricane base class loss cost shown in row 13. Because a modeled hurricane base class loss cost is not included in the MH(C) Liability calculations, the total base class loss cost is equal to the credibility-weighted loss cost for this coverage.

As noted at the beginning of my testimony, it is the total base class loss cost that begins the calculation of the indicated rate change on page 1 of Section C. The total base class loss cost is copied into row 1 on page 1 so that additional adjustments and calculations can be completed to develop the statewide indicated rate change for each MH(C) coverage.

Q. Up until now, your testimony has focused on the calculations on pages 1 through 3 of Section C. Please explain how pages 4 through 9 compare to pages 1 through 3.

A. As described in my testimony above, page 1 of Section C develops the statewide indicated rate changes for the major coverages offered in the mobile homeowners MH(C) program. As noted previously, those coverages include Mobile Home Structures, Adjacent Structures, Personal Effects, and Liability. The calculations to develop the indicated rate change for each coverage begin with the *total base class loss cost*, which is derived on pages 2, 4, 6, and 8 of

Section C, depending on the coverage. My testimony above discussed the calculations on page 2, which are further supported by additional calculations on page 3. The calculations on pages 2 and 3 of Section C all relate to Mobile Home Structures.

Pages 4 through 9 of Section C display comparable calculations for the three remaining MH(C) coverages: Adjacent Structures is documented on pages 4 and 5, Personal Effects is documented on pages 6 and 7, and Liability is documented on pages 8 and 9. The calculations and methodology on pages 4 and 6 are identical to the calculations and methodology on page 2 (except for the differences noted above in the exposure-based standards for full credibility). Similarly, the calculations and methodology on pages 5 and 7 are identical to the calculations and methodology on page 3.

The Liability calculations on page 8 are similar to page 2 with one exception – a *modeled hurricane base class loss cost* is not included in the calculation of the Liability *total base class loss cost* since modeled hurricane losses only relate to property coverages. As a result, the calculations on page 8 conclude with the *credibility-weighted loss cost*, which is conceptually equivalent to the *total base class loss cost* that can be found as the final calculation on pages 2, 4, and 6 for the MH(C) property coverages.

Similar to page 8, the Liability calculations on page 9 are comparable to page 3 except that adjustments for excess wind and excess flood loss and ALAE are not necessary. As a result, page 9 documents the application of loss and ALAE development factors and ULAE factors for each year in the experience period in order to derive the ultimate loss and LAE.

Q. Does the filing review the indicated rate changes by territory or territory group?

- A. Yes. The mobile homeowners MH(C) territory definitions are consistent with the territory definitions currently in use in homeowners and dwelling insurance in North Carolina. To increase the credibility and stability of the rates being evaluated, six territory groups are used in the mobile homeowners program. It should be noted that the rates for MH(C) Liability do not vary by territory group, but instead, a statewide base rate is used for all policies purchasing Liability coverage.

Beginning on page 10 of Section C, the Rate Bureau develops indicated rate changes by territory group for each MH(C) property coverage using a similar methodology as the statewide indication. Pages 10 through 20 document the Mobile Home Structures indicated rate changes by territory group, and the indicated rate changes by territory group for Adjacent Structures and Personal Effects are documented on pages 21 through 31 and pages 32 through 42, respectively.

For each of these MH(C) property coverages, a non-hurricane base class loss cost is calculated by territory group using the historical loss experience. A credibility value is assigned to each territory group for each coverage based on the number of house years underlying each loss cost and the same credibility standards discussed above. Using the credibility for each territory group, a credibility-weighted non-hurricane base class loss cost is determined by territory group. In addition, a modeled hurricane base class loss cost is developed by territory group for each coverage. The non-hurricane loss costs and modeled hurricane loss costs are combined to develop the indicated base class loss cost by territory group for each coverage. Additional calculations are applied to each territory group to reflect expenses, policyholder dividends, compensation for assessment risk, net cost of reinsurance, and net deviations in a similar manner as applied at a statewide level. The result of these calculations is an indicated rate change by territory group for each MH(C) property coverage.

Additional columns on pages 10, 21, and 32 of Section C show the proposed rate change by territory group, as selected by the Rate Bureau in capping the indicated rate changes.

In my opinion, the methodology used to develop the indicated rate-level change by territory group and by MH(C) property coverage is reasonable and is consistent with widely-used actuarial ratemaking practices.

Q. Does the filing review the wind exclusion credits?

A. Yes. Based on the rates being proposed with this filing in territory groups 1 and 2 for each MH(C) property coverage, the wind exclusion credits are being updated in a corresponding manner, as can be seen on page 23 of Section D. Using the underlying formula for the statewide rate indication, an adjustment is made to the appropriate components of the indication formula to reflect the non-wind losses as a percent of the total losses. The indicated non-wind rate is subtracted from the indicated overall rate to determine the indicated wind exclusion credit for each territory group.

Q. Does the filing include proposed changes to any rating variables used in the mobile homeowners MH(C) rating plan?

A. Yes. With this filing, the Rate Bureau is proposing revisions to the amount of insurance relativities and is introducing several new all-peril, windstorm and hail, and named storm deductible options.

To determine the revised amount of insurance relativities, we reviewed five years of experience using a one-way pure premium analysis for each mobile homeowners MH(C) coverage. The proposed revisions to the amount of insurance relativities are generally moving in the direction of the indicated factors

but are tempered by the Rate Bureau to reduce the impact on individual policyholders. Pages 1 through 5 of Section D summarize the Rate Bureau's analysis of the amount of insurance relativities.

Pages 6 through 22 of Section D summarize the additional deductible options being introduced as well as the corresponding premium credits or deductible relativities. Proposed credits or relativities are provided for each type of deductible (all-peril, windstorm or hail, or named storm), each coverage, and each combination of policy form (comprehensive or named perils) and occupancy type (primary residence or seasonal/vacation).

More details on the amount of insurance rating plan analysis and the proposed rating plan changes can be found in the Explanatory Memorandum included in Exhibit RB-1.

In my opinion, the methodology used to develop the proposed changes to the rating variables described above is reasonable and is consistent with widely-used actuarial ratemaking practices.

- Q. I understand that you are not providing an opinion concerning the underwriting profit (profit) provision or the development of the net cost of reinsurance (NCOR) provision. If I ask you to assume that the provisions for profit and NCOR are reasonable and actuarially sound, then in your opinion, is the overall rate indication shown in the mobile homeowners MH(C) filing by the North Carolina Rate Bureau reasonable?**
- A. Yes, if I assume that the provisions for profit and NCOR are reasonable, then in my opinion, the overall mobile homeowners MH(C) rate indication shown by the Rate Bureau, and the rate indications for each coverage, are reasonable and actuarially sound.
- Q. Again, assuming that the provisions for profit and NCOR are reasonable, do you have an opinion whether the proposed rates, as capped in the filing, reasonably provide for the expected costs for mobile homeowners MH(C) insurance in North Carolina?**
- A. If I assume that the provisions for profit and NCOR are reasonable, then in my opinion, the proposed rates in this filing reasonably reflect the expected costs for mobile homeowners MH(C) insurance, except to the extent that the proposed rates have been capped. In those territory groups where the Rate Bureau has capped the rates in this filing to mitigate the impact on affected policyholders, the proposed rates do not reflect all expected costs. The expected costs that can be quantified by the difference between a territory group's indicated rate change and its capped rate change are not reflected in the proposed rates.

Q. Assuming that the provisions for profit and NCOR are reasonable, in your opinion, are the proposed mobile homeowners MH(C) rates not excessive, inadequate, or unfairly discriminatory?

A. If I assume that the provisions for profit and NCOR are reasonable, then in my opinion, the proposed mobile homeowners MH(C) rates in this filing are not excessive or unfairly discriminatory. Similarly, the rates in those territory groups unaffected by the proposed caps are not inadequate; however, in those territory groups where the Rate Bureau is proposing to cap the effect of this filing, the proposed rates continue to be inadequate by the difference between the indicated rate change and the capped rate change.

Q. Does this conclude your testimony?

A. Yes, it does.

North Carolina Insurance Underwriting Association (NCIUA) -- Beach Plan

Catastrophe Bond Profit Multiples

Adjusted Profit Multiples by Average Probability of Loss

Source: Lane Financial LLC, Annual Securitization Reviews (<http://lanefinancialllc.com>).

Notes: Based on near-term cat bonds issued from January 2011 to March 2020.

Includes all U.S. bonds with a probability of first loss between 0.05% and 20.0%; excludes bonds with no stated profit multiples.

Profit multiples were adjusted based on the year each bond was issued in order to normalize for different market conditions by year.

Equation of the fitted curve:

$$y = 0.10982 x^{-0.75557}$$

Equation to determine average Profit Multiple over specific interval:

$$\text{Avg PM} = \int_a^b 0.10982 x^{-0.75557} dx / (b-a)$$

1 **PRE-FILED DIRECT TESTIMONY OF MINCHONG MAO**

2
3 **2021 MOBILE HOME INSURANCE RATE FILING**

4 **by the**

5 **NORTH CAROLINA RATE BUREAU**

6
7
8 **Q. Please state your full name and business address for the record.**

9
10 A. My name is Minchong Mao. My business address is Aon, 200 East Randolph
11 Street, 11th Floor, Chicago, Illinois 60601.

12
13 **Q. What is your involvement in this matter?**

14
15 A. My employer, Aon, has been retained by the North Carolina Rate Bureau
16 (NCRB) to provide catastrophe and reinsurance analytics with respect to the
17 expected hurricane losses utilized in the NCRB 2021 Mobile Home Insurance
18 rate filing. I am part of the catastrophe analytics team at Aon that performed
19 these services.

20
21 **Q. What are your primary responsibilities for Aon?**

22
23 A. I am a Managing Director and a Catastrophe Actuary at Aon's Reinsurance
24 Solutions - Catastrophe Risk Analytics group. I advise clients on catastrophe
25 actuarial services, such as rate indications, rate filing strategy, underwriting

1 strategy, and use of catastrophe models in risk management. I am responsible
2 for Aon's compliance with ASOP 38 regarding the use of catastrophe models. I
3 am a consulting actuary for Aon's in-house model, Impact Forecasting, LLC. I
4 work with a group of catastrophe modelers to provide catastrophe modeling
5 support for reinsurance placements. Our client services include but are not
6 limited to support for multi-model analytics, customized view of risks, catastrophe
7 pricing, catastrophe risk selections, data augmentation, model evaluation, real-
8 time event response, portfolio optimization, actuarial support, reinsurance cost
9 allocations, and rating agency questionnaire support.

10

11 **Q. Describe your professional and educational background.**

12

13 A. I have been with Aon since September 2018. Prior to joining Aon, I worked at
14 State Farm Insurance Companies for over 17 years from 2001 to 2018, where I
15 led the catastrophe modeling functions since 2005. During my tenure at State
16 Farm, I was responsible for State Farm's use of catastrophe models in pricing,
17 underwriting, claims, reinsurance, securitization, enterprise risk management,
18 and rating agency reporting.

19

20 I had 2 years of rate making experience as a pricing actuary for Homeowner lines
21 at State Farm. I am familiar with the development and implementation of
22 property insurance rates and rules. I understand the challenges for an insurer to
23 balance rate adequacy, competitiveness, and meet financial objectives at the
24 same time.

1

2 I have a Bachelor's degree in Biochemical Engineering from Beijing University of
3 Chemical Technology, a Master's degree in Chemistry from Eastern Illinois
4 University, and a Master's degree in Computer Science from the University of
5 Missouri - Columbia.

6

7 **Q. Are you a member of any professional actuarial organizations?**

8

9 A. Yes. I am a Fellow of the Casualty Actuarial Society (FCAS), and a Member
10 of the American Academy of Actuaries (MAAA). I am a Certified Catastrophe
11 Risk Management Professional (CCRMP), a new designation created by the
12 CAS Institute (iCAS) and International Society of Catastrophe Managers (ISCM).
13 I am currently serving on the Casualty Actuarial Society's Climate Change
14 Committee, American Academy of Actuaries' Extreme Event Risk Committee,
15 and on the advisory board for CCRMP designation. I am in good standing with
16 the requirements of all of these organizations.

17

18 I am part of a working group that authored the following monographs for the
19 American Academy of Actuaries:

- 20 • The National Flood Insurance Program: Challenges and Solutions (2017)
- 21 • Uses of Catastrophe Model Output (2018)
- 22 • Wildfire: An Issue Paper - Lessons Learned from the 2017–2018
23 California Events (2019)

1 I am one of the recipients of the Casualty Actuarial Society's Above and Beyond
2 Achievement Award in 2019 to recognize my leadership and contributions to
3 establish the CCRMP designation for the insurance industry.

4

5 **Q. Please describe your relevant experience and qualifications for this**
6 **proceeding.**

7

8 A. I started practicing in the catastrophe risk management field in 2005. During
9 my tenure at State Farm, I managed State Farm's catastrophe modeling function
10 from 2005 to 2018. I managed vendor relationships with AIR, EQECAT, ARA,
11 and RMS. I provided filing support and helped my employer through many
12 regulatory challenges related to the use of models in insurance operations. I
13 provided actuarial opinions on State Farm's use of catastrophe models. I
14 established the due diligence and model validation framework to ensure
15 catastrophe modeling practices at State Farm met the actuarial standards and
16 complied with laws and regulatory requirements. My team provided various
17 catastrophe risk measures and analytics for State Farm Fire and affiliates for rate
18 making, exposure management, claims, ERM, rating agency reporting,
19 reinsurance and securitization purposes.

20

21 From 2010 to 2013, I was a member of an advisory group to the Insurance
22 Bureau of Canada (IBC) and Office of the Superintendent of Financial Institutions
23 (OSFI) to provide expert opinions on insurance and the economic impact of

1 major earthquakes in Canada. From 2011 to 2013, I was a member of an
2 advisory group for IBC and OSFI to revise OSFI Guideline B-9 (Earthquake
3 Exposure Management Sound Practice Guideline for insurance companies). I
4 led a State Farm team to establish the compliance framework to meet OSFI B-9
5 regulation requirements.

6

7 In January 2015, I was appointed by Florida CFO Jeff Atwater to serve on the
8 Florida Commission on Hurricane Loss Projection Methodology (FCHLPM) as
9 the industry actuary. From January 2015 to September 2018, I represented the
10 property insurance industry on the FCHLPM to review and accept hurricane
11 models for use in ratemaking in the State of Florida. My term on the FCHLPM
12 ended in September 2018 due to my job change.

13

14 The hurricane models used for this rate filing, AIR Touchstone V7.3 and RMS
15 RiskLink V18.1, are both certified by FCHLPM.

16

17 **Q. Please describe how ASOP 38 is applicable in this rate filing?**

18

19 A. The Actuarial Standard of Practice Number 38 (ASOP 38) has been in effect
20 since December 2000. ASOP 38 was created, to some extent, to address the
21 use of stochastic computer hurricane simulation models in the insurance rate
22 making process. ASOP 38 established certain requirements for actuaries who
23 use output from a model that is outside of that actuary's area of expertise.

1 Hurricane models are developed by a group of experts including meteorologists,
2 structural engineers, actuaries, statisticians and computer scientists. Some
3 model components are outside of the area of expertise of actuaries. Due to their
4 complexity and reliance on different science disciplines, as well as the relative
5 newness of their use in establishing property insurance rates at the time, many
6 actuaries are not as knowledgeable about these models as they are about the
7 traditional rate making methodologies.

8

9 Hurricane models are utilized to establish the hurricane loss cost and
10 reinsurance cost allocation for this NCRB filing. Therefore, compliance with
11 ASOP 38 is relevant to the filing.

12

13 **Q. Is Aon's use of catastrophe models in compliance with ASOP 38?**

14

15 A. Yes, Aon's catastrophe modeling practice in general, and as it relates to this
16 NCRB filing, is in compliance with ASOP 38. ASOP 38 provides guidance to the
17 actuary in using models that incorporate specialized knowledge outside the
18 actuary's own area of expertise when developing an actuarial work product.
19 When using such a model, the standard requires that the actuary perform five
20 specific tasks:

21

- 22 a. Determine appropriate reliance on experts;
- 23 b. Have a basic understanding of the model;

- 1 c. Evaluate whether the model is appropriate for the intended application;
- 2 d. Determine that appropriate validation has occurred; and
- 3 e. Determine the appropriate use of the model.

4

5 In addition to relying on model vendors' experts, Aon has an in-house model
6 evaluation team. This team consists of members with advanced degrees in
7 meteorology, structural engineering and statistics. Soon after models are
8 released, the model evaluation team performs sensitivity testing to identify key
9 drivers of model changes and potential anomalies. I work closely with the model
10 evaluation team at Aon to ensure that the sensitivity testing covers all aspects of
11 ASOP 38 requirements. I review the testing results through an analytics
12 dashboard. I document my reviews for each model. Upon completion of the
13 review, I sign an ASOP 38 attestation. Copies of the current ASOP 38
14 attestations for the AIR and RMS models are included in the filing as Exhibits
15 RB-9 and RB-10, respectively.

16

17 **Q. Describe the role of Aon Reinsurance Solutions Analytics and**

18 **Catastrophe Risk Analytics.**

19

20 A. Aon Reinsurance Solutions Analytics (a.k.a Reinsurance Analytics) provides
21 consultative services to Aon's clients who place catastrophe reinsurance through
22 Aon. These clients are primary insurers selling property insurance products in
23 catastrophe prone areas. Aon Reinsurance Analytics provides value added

1 service that is above and beyond reinsurance brokering transactions. Our client
2 services include but are not limited to support for multi-model analytics,
3 customized view of risks, catastrophe pricing, catastrophe risk selections, data
4 augmentation, model evaluation, real-time event response, portfolio optimization,
5 reinsurance cost allocations, actuarial support and rating agency questionnaire
6 support.

7

8

9 Within the Reinsurance Analytics division, there is a team specialized in
10 catastrophe risk analytics. I am part of the catastrophe risk analytics team that
11 provides clients with catastrophe risk management information and assists
12 clients with their reinsurance purchasing decisions.

13

14 **Q. Describe your experience with catastrophe models.**

15

16 A. From 2005 to 2006, I performed the catastrophe modeling analyst's role,
17 which includes hands-on experience with multiple models - from data preparation
18 to running the models, to post model aggregation. My daily work involved data
19 preparation and converting exposure data into model input files. I gained
20 knowledge about how different models handle building characteristics and
21 insurance terms. I used RMS RiskLink, AIR Clasic/2, and EQECAT models on a
22 daily basis. I developed an understanding of the models' back end database and
23 output. I performed post model analysis and wrote computer programs to
24 develop risk metrics such as PMLs, AALs, and TVaR to help State Farm assess

1 and manage catastrophe risks. Later in my career, I assembled a team and
2 delegated many modeling tasks to my colleagues. I stayed involved by providing
3 guidance and managing the day to day work of the catastrophe modeling unit.

4

5 **Q. Describe your experience with catastrophe reinsurance.**

6

7 A. My experience with reinsurance started in 2005 at State Farm. State Farm is
8 a reinsurance buyer and I was a part of the company's reinsurance buying team.
9 I supported the reinsurance function at multiple levels. My work included using
10 catastrophe model output and financial information to help my employer in
11 structuring reinsurance, conducting technical pricing, drafting and reviewing
12 reinsurance contracts, and participating in reinsurance buying trips. I evaluated
13 catastrophe risks and cost of capital from both ceding and assuming parties. I
14 worked closely with our reinsurance broker to validate our view of risks using
15 external benchmarks. At Aon, I work directly with our clients who are seeking to
16 purchase catastrophe reinsurance. Output from models is used by our brokers,
17 clients, and capital markets to determine the reinsurance structure and pricing.
18 We customize reinsurance solutions based on clients' risk appetite and risk
19 profile.

20

21 **Q. Do you speak on topics pertaining to catastrophe modeling?**

22

23 A. Yes. I have presented at CAS Ratemaking, Product and Modeling
24 Conferences. I am a frequent speaker at Reinsurance Association of America's

1 annual catastrophe modeling conference. My topics have included model
2 blending, model regulation, and wildfire modeling, among others. From 2012 to
3 2018, I was a visiting instructor for the Illinois State University Math Department
4 Actuarial Science program. I presented catastrophe modeling and regulatory
5 topics to actuarial students. From 2016 to 2018, I was a member of the planning
6 committee for the Reinsurance Association of America's annual catastrophe
7 modeling conference. I organized and moderated panels and engaged speakers
8 to cover a variety of catastrophe topics.

9

10 **Q. What was Aon's role in this filing with respect to expected hurricane**
11 **losses?**

12

13 A. Aon performed data validation and shared control totals with NCRB; Aon's
14 catastrophe modelers ran AIR Touchstone V7.3 and RMS RiskLink V18.1
15 models based on exposure data provided by NCRB; Aon blended the model
16 results for NCRB based on well-established methodology and provided the
17 modeled average annual loss to NCRB; Aon conducted industry research,
18 recommended and applied loss adjustment factors for NCRB.

19

20 **Q. Did the NCRB ask Aon to run the AIR and RMS models?**

21

22 A. Yes. Aon ran AIR Touchstone and RMS RiskLink for the NCRB under the
23 NCRB's direction. AIR and RMS are the most commonly used catastrophe
24 models in the insurance and reinsurance industries. Aon runs these two models

1 on all of Aon clients' exposure data pertinent to reinsurance transactions. The
2 majority of Aon's clients use either one or both of these two models when
3 evaluating their catastrophe risk.

4

5 **Q. How are losses from two models blended?**

6

7 A. Model results are blended by taking a straight average toward the end of the
8 process. This means that we run the individual models and determine the
9 appropriate loss costs and reinsurance cost allocation independently for each
10 model. Then the outcome from the two models is averaged.

11

12 **Q. Is it common that modeled losses will differ between the various model**
13 **vendors?**

14

15 A. Yes. Catastrophe models are complex. When modeling vendors develop a
16 hurricane model, they start with similar underlying information, such as the
17 National Hurricane Center's historical hurricane dataset, land use/land cover
18 database, similar wind engineering principles and statistical theories. However,
19 there are differences between modeling vendors in their approaches to
20 interpreting and supplementing the data to build a robust model. Different
21 assumptions and judgements are made by model developers. Vendors may also
22 use claims data from different data sources to calibrate their model. These
23 varying assumptions, judgements, and methodologies will result in different
24 model results. Model results deviate more at location level than at the state

1 level. When models generate different results, it does not necessarily mean any
2 model is wrong. The spread among different views of the same risk is expected,
3 and it reflects the inherent uncertainties of catastrophe modeling.

4

5 Given the number of variables involved in the development of a catastrophe
6 model and the degree of uncertainty associated with each variable, we would not
7 expect that two independently developed models would result in the same output
8 or conclusions on a given set of data.

9

10 **Q. How do the models change over time?**

11

12 A. Catastrophe models are built based on state of the art science and
13 technology. As science continues to evolve and computing powers continue to
14 advance, modeling technology is updated and improved. In addition, research
15 into historical and recent events, updates to building practices and building
16 codes, and data from engineering experiments will also provide insights to
17 enable model developers to enhance their models. Each modeling vendor takes
18 a different approach on how frequently it updates its models and which perils and
19 regions will be updated. As noted above, because different assumptions and
20 judgements are made when information is applied, the impact of an update could
21 vary greatly between models. Changes due to model updates are to be
22 expected.

23

1 **Q. Is using multiple models to determine catastrophe risk actuarially**
2 **sound?**

3

4 A. Yes. Using multiple models allows users to incorporate different views of risk
5 into their exposure management. Using multiple models can effectively mitigate
6 modeling volatility and smooth out significant model changes. Using multiple
7 models is a practice endorsed by major rating agencies such as AM Best and
8 S&P.

9

10 **Q. How does the NCRB exposure data impact model output?**

11

12 A. The following data factors would impact model output:

- 13 • Changes in coverage and/or policy conditions such as deductible and
14 limits, and the underlying policies-in-force
- 15 • Changes in portfolio composition, such as geographic concentration
- 16 • Changes in building characteristics, such as loss mitigation features and
17 age of roof
- 18 • Changes in data quality, such as replacing unknown building
19 characteristics with known building characteristics

20

21 **Q. Please describe the client data that was employed as input for the model**
22 **runs?**

23

24 A. The underlying exposure data was provided to Aon by the NCRB. To the best
25 of my knowledge, the data was compiled on behalf of the NCRB by Milliman, Inc.

1 NCRB's exposure data sent to Aon consisted of the aggregate exposure
2 information for all residential Mobile Home risks in North Carolina at program,
3 zip, county and territory level. Data with invalid zip codes or county designations
4 were disaggregated and reassigned to valid zips/counties within the given
5 territory using mobile home unit count by CBG (census block group) from the
6 2018 American Community Survey maintained by the Census Bureau. Territory
7 was populated, except for data that was part of zip codes split across two
8 territories, and the exposure in the split zip code was proportionally assigned to
9 territories based on mobile home unit count by CBG. The number of risks was
10 derived from accrued earned exposures with partial numbers. Any partial
11 numbers of risk count that are greater than zero were rounded to at least 1,
12 because the models require the number of risks to be input as an integer.
13 Rounding up resulted in slight increasing of the risk count. NCRB instructed Aon
14 to run the models using the aggregate data at zip code and territory level for the
15 entire North Carolina portfolio in a single model run. Model results were
16 aggregated at the territory level.
17
18 Milliman provided trend factors to Aon which were applied to the aggregated data
19 also sent to Aon. In the 2019 filing, trending factors were applied to modeled
20 losses after model runs. This new method of applying trend to exposures before
21 modeling is a more precise way to reflect policy terms in modeled results.
22

1 **Q. Please describe what Aon Reinsurance Solutions then did with the data**
2 **provided by the NCRB.**

3

4 A. We reviewed the data received from the NCRB for completeness and
5 reasonableness before we input it into the AIR and RMS models. Since the two
6 models have different formats for inputting data, we worked with the NCRB to
7 assure that the exposure data was properly and consistently mapped in the
8 required format for each model. NCRB provided earned insurance years (EIY)
9 broken out by coverages A-D and earned house years (EHY), which is the
10 number of risks. A comparison of this year's data with the data from the prior
11 filing was conducted. Any anomalies were investigated.

12

13 The next step was to input the data and run the models. We ran the AIR
14 Standard model using the 100K event catalogue and the RMS Historical model
15 (both are long term views of the hurricane risk) to determine the modeled
16 hurricane loss cost. We also ran the AIR Warm Sea Surface Temperature
17 (WSST) model and the RMS Medium Term Rate model (both are near term
18 views of hurricane risk) to analyze the cost of reinsurance. It is a standard
19 practice throughout the reinsurance industry to rely upon the models we used to
20 determine modeled hurricane loss cost and reinsurance placements, and this has
21 been true since the 1990s.

22

23 After the models were run, we reviewed each model's output separately to
24 ensure data integrity. We then blended the results of the two models by taking a

1 straight average of the results. Additional reviews were conducted of the blended
2 results to ensure that the blending procedures were correctly performed and that
3 the blended results were reasonable. The blended modeled hurricane loss
4 results were provided to the NCRB for use in its Mobile Home rate review. At the
5 NCRB's request, we also provided the results to Milliman for its use in its rate
6 filing work as part of the NCRB's Mobile Home rate review. Exhibit RB-8 sets
7 forth the blended modeled hurricane losses resulting from the work I have
8 described. Based on my knowledge and experience, and the input data provided
9 by the NCRB, these modeled hurricane losses are reasonable and appropriate
10 projections of expected hurricane losses for use by the NCRB in its Mobile Home
11 rate review and rate filing.

12

13 Also, we employed the modeled hurricane losses as part of our work in
14 determining and allocating the cost of reinsurance. My colleague, Steve Fiete,
15 led our analysis of the net cost of reinsurance, and his testimony is also included
16 in this filing.

17

18 **Q. Did Aon make adjustments to modeled results?**

19

20 Yes. A 6% loss adjustment expense (LAE) factor was applied to modeled
21 losses. This factor was recommended by Aon based on a broad industry study
22 at the state level. The results of that study are shown in Exhibit RB-14. The
23 application of the LAE factor was reviewed and approved by the NCRB, and the
24 6% catastrophe LAE factor was selected by the NCRB.

1

2

3 **Q. Does that conclude your testimony?**

4

5 A. Yes.

Modeled hurricane expected losses for North Carolina Rate Bureau, net of limits and deductibles. Results include demand surge and storm surge. Losses represent 50/50 blend of AIRv7.3 100k Standard event set and RMSv18.1 Historical event set. Results also include provisions for LAE and loss trend.

Aon ASOP 38 attestation - AIR Model

Statement of Compliance with Actuarial Standard of Practice 38 Minchong Mao, FCAS, MAAA

Background

Actuarial Standard of Practice 38 provides guidance to the actuary in using models that incorporate specialized knowledge outside the actuary's own area of expertise when developing an actuarial work product. When using such a model, the standard requires that the actuary perform five specific tasks, as described below using the numbering system of the standard. This document certifies that Minchong Mao, FCAS, MAAA, has performed these tasks for the catastrophe loss model(s) relied upon in the actuarial work product to which it is attached. It is intended that actuaries utilizing the actuarial work product in their insurance ratemaking efforts can rely on my model evaluation in accordance with Section 3.7 of the standard of practice.

Model Versions Covered by this document

- AIR Hurricane model for the United States v17.0.0 utilized in Touchstone versions 6.1.0, 7.0 and 7.x, released in 2019
- AIR Severe Thunderstorm Model for the United States v7.0 implemented in Touchstone version 5, 6, 7 and 7.x, released in 2019
- AIR Winter Storm Model for the United States v1.5 implemented in Touchstone version 5, 6, 7 and 7.x, released in 2019
- AIR Wildfire Model for the United States v2 implemented in Touchstone version 6, 7 and 7.x, released in 2019
- AIR Earthquake and Fire Following Model for the United States v10.1 implemented in Touchstone version 6, 7 and 7.x, released in 2019. This version included Time Dependent Earthquake Hazard Adjustment.

3.2 Appropriate Reliance on Experts

An actuary may rely on experts concerning those aspects of a model that are outside of the actuary's own area of expertise. The experts relied upon may either be the experts who provided the model or other experts.

For those aspects of the model that are outside my area of expertise, I have relied on the list of experts provided by the modeler. Please see the modeler's ASOP 38 document and supporting documentation for additional information.

In determining the appropriate level of reliance, the actuary should consider the following:

a. whether the individual or individuals upon whom the actuary is relying are experts in the applicable field;

The individuals listed as employees of the modeler appear to be experts in their respective fields.

b. the extent to which the model has been reviewed or opined on by experts in the applicable field, including any known significant differences of opinion among experts concerning aspects of the model that could be material to the actuary's use of the model; and

The modeler has provided documentation of reviews by outside experts. Many of these reviewers are well-recognized experts in their fields. I have reviewed the findings of the outside experts and found no significant differences of opinion with respect to the validity of the model.

c. whether there are standards that apply to the model or to the testing or validation of the model, and whether the model has been certified as having met such standards.

Standards for catastrophe loss models have been promulgated by a few states. Most notably, the Florida Commission on Hurricane Loss Projection Methodology was created to review catastrophe loss models. The model(s) used in this work product, or derivatives thereof, have been certified by the Florida Commission on Hurricane Loss Projection Methodology.

3.3 Understanding of the Model

The actuary should be reasonably familiar with the basic components of the model and understand both the user input and the model output, as discussed below.

I have reviewed the modeler's ASOP 38 document and supporting documentation describing the model's components, input, and output, as well as other documentation, to comply with this requirement. In addition, I have specialized in actuarial applications of catastrophe model output since 2005.

3.3.1 Model Components—The actuary should be reasonably familiar with the basic components of the model and have a basic understanding of how such components interrelate within the model. In addition, the actuary should identify which fields of expertise were used in developing or updating the model, and should make a reasonable effort to determine if the model is based on generally accepted practices within the applicable fields of expertise. The actuary should also be reasonably familiar with how the model was tested or validated and the level of independent expert review and testing.

I am reasonably familiar with the basic components of the model and have a basic understanding of how such components interrelate within the model. I have identified the fields of expertise used in developing and updating the model and have determined that the model is based on generally accepted practices within the applicable fields of expertise. I am reasonably familiar with how the model was validated and have reviewed the documentation of reviews by outside experts.

3.3.2 User Input—Certain user input may be required to produce model output for the specific application. The actuary should understand the user input that is required to produce the model output. This understanding includes the level of detail required in the user input to produce results that are consistent with the intended use of the model.

I understand the user input required to produce model output, including the level of detail required to produce results that are consistent with insurance ratemaking and risk management applications.

3.3.3 Model Output—The actuary should determine that the model output is consistent with the actuary's intended use of the model.

I have determined that the model output is consistent with the insurance ratemaking applications for which it was used. We most often use event loss detail in our work, so we are always careful that our results balance to the model's prepared exhibits.

3.4 Appropriateness of the Model for the Intended Application

The actuary should evaluate whether the model is appropriate for the particular actuarial analysis, and consider limitations of the model, modifications to the model, and the assumptions needed in order to apply the model output.

The catastrophe model(s) we have relied upon were developed for purposes related to the management of risk. I have evaluated the model(s) in light of available alternatives and determined that the catastrophe loss model is the most appropriate method of estimating expected catastrophe loss distributions for insurance ratemaking.

Some additional considerations include the following:

a. Applicability of Historical Data—To the extent historical data are used in the development of the model or the establishment of model parameters, the actuary should consider the adequacy of the historical data in representing the range of reasonably expected outcomes consistent with current knowledge about the phenomena being analyzed.

Historical data is relied upon extensively in the development and validation of catastrophe loss models. Smoothing procedures are applied in cases where reasonably foreseeable events are underrepresented in the historical data.

b. Developments in Relevant Fields—The actuary should make a reasonable effort to be aware of significant developments in relevant fields of expertise. The actuary should evaluate whether such developments are likely to materially affect the current actuarial analysis.

Catastrophe loss models are typically updated on an annual basis in order to incorporate the most current scientific research and information from recent catastrophe events.

I have made a reasonable effort to be aware of significant developments in the relevant fields of expertise. In particular, meteorological studies related to the current period of elevated hurricane activity are important in determining which of a model's frequency assumptions should be utilized in insurance ratemaking applications involving hurricane-exposed risk portfolios. Aon maintains a documentation library containing current research in the science of catastrophe perils.

3.5 Appropriate Validation

The actuary should evaluate the user input and the reasonableness of the model output, as discussed below.

3.5.1 User Input—With respect to the quality and availability of the user input data to be used in the model, the actuary should refer to ASOP No. 23, Data Quality.

The model input data for this analysis was supplied by the client. The data was reviewed for reasonableness in accordance with ASOP 23.

3.5.2 Model Output—In view of the intended use of the model, the actuary should examine the model output for reasonableness, considering factors such as the following:

a. the results derived from alternate models or methods, where available and appropriate;

In addition, Aon conducts extensive testing of each model that we license whenever a new model is released. Output from Model output is checked for reasonability against other models and for consistency with the modeler's representations as to changes incorporated in the current version. I have reviewed the results of these tests and found the model used in this analysis to provide reasonable output.

b. how historical observations, if applicable, compare to results produced by the model;

Catastrophes, by their nature, involve significant uncertainty in the amount of insured losses they produce. In light of this uncertainty, the model has been shown to produce reasonable estimates of losses incurred from historical events.

I have reviewed the modeler's ASOP 38 document and supporting documentation describing comparisons of model output to historical observations and found that the model produces reasonable estimates.

c. the consistency and reasonableness of relationships among various output results; and

I have reviewed the relationships among output results and found them to be consistent and reasonable.

d. the sensitivity of the model output to variations in the user input and model assumptions.

Aon conducts extensive testing of each model that we license with respect to the sensitivity of model output to variations in the user input and model assumptions. I have reviewed the results of these tests and obtained an understanding of the model's sensitivity.

3.6 Appropriate Use of the Model

Having completed the analysis described in sections 3.2–3.5 above, the actuary should use his or her professional judgment to determine whether it is appropriate to use the model results, subject to any appropriate adjustments. The actuary should disclose any such adjustments in accordance with section 4.3.

In my professional judgment, it is appropriate to use the model results, without adjustment, for the purposes of the actuarial work product to which this document is attached.

3.7 Reliance on Model Evaluation by Another Actuary

The actuary may rely on another actuary who has, for a particular model, conducted some or all of the evaluations and processes described in this standard. However, the relying actuary should be satisfied that the other actuary's evaluation was performed in accordance with this standard and is appropriate for the intended application. The actuary should document the extent of such reliance in accordance with section 4.1.

Actuaries utilizing the actuarial work product to which this document is attached can rely on my complete evaluation of the model(s) used as described above. In doing so, they should document the extent of such reliance in their work.

A handwritten signature in black ink that reads "Minchong Mao". The signature is written in a cursive style.

Aug 13th 2020

Aon ASOP 38 attestation - RMS Model

Statement of Compliance with Actuarial Standard of Practice 38 Minchong Mao, FCAS, MAAA

Background

Actuarial Standard of Practice 38 provides guidance to the actuary in using models that incorporate specialized knowledge outside the actuary's own area of expertise when developing an actuarial work product. When using such a model, the standard requires that the actuary perform five specific tasks, as described below using the numbering system of the standard. This document certifies that Minchong Mao, FCAS, MAAA, has performed these tasks for the catastrophe loss model(s) relied upon in the actuarial work product to which it is attached. It is intended that actuaries utilizing the actuarial work product in their insurance ratemaking efforts can rely on my model evaluation in accordance with Section 3.7 of the standard of practice.

Model Versions Covered by this document

- RMS North Atlantic Hurricane Model v18.1, released in 2019, implemented in RiskLink V18,1
- RMS North America Earthquake Model v17.0, released in 2017, implemented in RiskLink V17, 18, and 18.1
- RMS Sever Convective Storm Model for the United States, released in 2014, implemented in RiskLink V17,18, and 18.1
- RMS Winter Storm Model for the United States, release in 2013, implemented in RiskLink V17,18, and 18.1

3.2 Appropriate Reliance on Experts

An actuary may rely on experts concerning those aspects of a model that are outside of the actuary's own area of expertise. The experts relied upon may either be the experts who provided the model or other experts.

For those aspects of the model that are outside my area of expertise, I have relied on the list of experts provided by the modeler. Please see the modeler's ASOP 38 document and supporting documentation for additional information.

In determining the appropriate level of reliance, the actuary should consider the following:

a. whether the individual or individuals upon whom the actuary is relying are experts in the applicable field;

The individuals listed as employees of the modeler appear to be experts in their respective fields.

b. the extent to which the model has been reviewed or opined on by experts in the applicable field, including any known significant differences of opinion among experts concerning aspects of the model that could be material to the actuary's use of the model; and

The modeler has provided documentation of reviews by outside experts. Many of these reviewers are well-recognized experts in their fields. I have reviewed the findings of the outside experts and found no significant differences of opinion with respect to the validity of the model.

c. whether there are standards that apply to the model or to the testing or validation of the model, and whether the model has been certified as having met such standards.

Standards for catastrophe loss models have been promulgated by a few states. Most notably, the Florida Commission on Hurricane Loss Projection Methodology was created to review catastrophe loss models. The model(s) used in this work product, or derivatives thereof, have been certified by the Florida Commission on Hurricane Loss Projection Methodology.

3.3 Understanding of the Model

The actuary should be reasonably familiar with the basic components of the model and understand both the user input and the model output, as discussed below.

I have reviewed the modeler's ASOP 38 document and supporting documentation describing the model's components, input, and output, as well as other documentation, to comply with this requirement. In addition, I have specialized in actuarial applications of catastrophe model output since 2005.

3.3.1 Model Components—The actuary should be reasonably familiar with the basic components of the model and have a basic understanding of how such components interrelate within the model. In addition, the actuary should identify which fields of expertise were used in developing or updating the model, and should make a reasonable effort to determine if the model is based on generally accepted practices within the applicable fields of expertise. The actuary should also be reasonably familiar with how the model was tested or validated and the level of independent expert review and testing.

I am reasonably familiar with the basic components of the model and have a basic understanding of how such components interrelate within the model. I have identified the fields of expertise used in developing and updating the model and have determined that the model is based on generally accepted practices within the applicable fields of expertise. I am reasonably familiar with how the model was validated and have reviewed the documentation of reviews by outside experts.

3.3.2 User Input—Certain user input may be required to produce model output for the specific application. The actuary should understand the user input that is required to produce the model output. This understanding includes the level of detail required in the user input to produce results that are consistent with the intended use of the model.

I understand the user input required to produce model output, including the level of detail required to produce results that are consistent with insurance ratemaking and risk management applications.

3.3.3 Model Output—The actuary should determine that the model output is consistent with the actuary's intended use of the model.

I have determined that the model output is consistent with the insurance ratemaking applications for which it was used. We most often use event loss detail in our work, so we are always careful that our results balance to the model's prepared exhibits.

3.4 Appropriateness of the Model for the Intended Application

The actuary should evaluate whether the model is appropriate for the particular actuarial analysis, and consider limitations of the model, modifications to the model, and the assumptions needed in order to apply the model output.

The catastrophe model(s) we have relied upon were developed for purposes related to the management of risk. I have evaluated the model(s) in light of available alternatives and determined that the catastrophe loss model is the most appropriate method of estimating expected catastrophe loss distributions for insurance ratemaking.

Some additional considerations include the following:

a. Applicability of Historical Data—To the extent historical data are used in the development of the model or the establishment of model parameters, the actuary should consider the adequacy of the historical data in representing the range of reasonably expected outcomes consistent with current knowledge about the phenomena being analyzed.

Historical data is relied upon extensively in the development and validation of catastrophe loss models. Smoothing procedures are applied in cases where reasonably foreseeable events are underrepresented in the historical data.

b. Developments in Relevant Fields—The actuary should make a reasonable effort to be aware of significant developments in relevant fields of expertise. The actuary should evaluate whether such developments are likely to materially affect the current actuarial analysis.

Catastrophe loss models are typically updated on an annual basis in order to incorporate the most current scientific research and information from recent catastrophe events.

I have made a reasonable effort to be aware of significant developments in the relevant fields of expertise. In particular, meteorological studies related to the current period of elevated hurricane activity are important in determining which of a model's frequency assumptions should be utilized in insurance ratemaking applications involving hurricane-exposed risk portfolios. Aon maintains a documentation library containing current research in the science of catastrophe perils.

3.5 Appropriate Validation

The actuary should evaluate the user input and the reasonableness of the model output, as discussed below.

3.5.1 User Input—With respect to the quality and availability of the user input data to be used in the model, the actuary should refer to ASOP No. 23, Data Quality.

The model input data for this analysis was supplied by the client. The data was reviewed for reasonableness in accordance with ASOP 23.

3.5.2 Model Output—In view of the intended use of the model, the actuary should examine the model output for reasonableness, considering factors such as the following:

a. the results derived from alternate models or methods, where available and appropriate;

In addition, Aon conducts extensive testing of each model that we license whenever a new model is released. Output from Model output is checked for reasonability against other models and for consistency with the modeler's representations as to changes incorporated in the current version. I have reviewed the results of these tests and found the model used in this analysis to provide reasonable output.

b. how historical observations, if applicable, compare to results produced by the model;

Catastrophes, by their nature, involve significant uncertainty in the amount of insured losses they produce. In light of this uncertainty, the model has been shown to produce reasonable estimates of losses incurred from historical events.

I have reviewed the modeler's ASOP 38 document and supporting documentation describing comparisons of model output to historical observations and found that the model produces reasonable estimates.

c. the consistency and reasonableness of relationships among various output results; and

I have reviewed the relationships among output results and found them to be consistent and reasonable.

d. the sensitivity of the model output to variations in the user input and model assumptions.

Aon conducts extensive testing of each model that we license with respect to the sensitivity of model output to variations in the user input and model assumptions. I have reviewed the results of these tests and obtained an understanding of the model's sensitivity.

3.6 Appropriate Use of the Model

Having completed the analysis described in sections 3.2–3.5 above, the actuary should use his or her professional judgment to determine whether it is appropriate to use the model results, subject to any appropriate adjustments. The actuary should disclose any such adjustments in accordance with section 4.3.

In my professional judgment, it is appropriate to use the model results, without adjustment, for the purposes of the actuarial work product to which this document is attached.

3.7 Reliance on Model Evaluation by Another Actuary

The actuary may rely on another actuary who has, for a particular model, conducted some or all of the evaluations and processes described in this standard. However, the relying actuary should be satisfied that the other actuary's evaluation was performed in accordance with this standard and is appropriate for the intended application. The actuary should document the extent of such reliance in accordance with section 4.1.

Actuaries utilizing the actuarial work product to which this document is attached can rely on my complete evaluation of the model(s) used as described above. In doing so, they should document the extent of such reliance in their work.

Minchong Mao FCAS, MAAA

Minchong Mao

Aug 13th 2020

1 **PRE-FILED DIRECT TESTIMONY OF MINCHONG MAO**

2
3 **2021 MOBILE HOME INSURANCE RATE FILING**

4 **by the**

5 **NORTH CAROLINA RATE BUREAU**

6
7
8 **Q. Please state your full name and business address for the record.**

9
10 A. My name is Minchong Mao. My business address is Aon, 200 East Randolph
11 Street, 11th Floor, Chicago, Illinois 60601.

12
13 **Q. What is your involvement in this matter?**

14
15 A. My employer, Aon, has been retained by the North Carolina Rate Bureau
16 (NCRB) to provide catastrophe and reinsurance analytics with respect to the
17 expected hurricane losses and net cost of reinsurance utilized in the NCRB 2021
18 Mobile Home Insurance rate filing. I am part of the catastrophe analytics team at
19 Aon that performed these services.

20
21 **Q. What are your primary responsibilities for Aon?**

22
23 A. I am a Senior Managing Director and a Catastrophe Actuary at Aon's
24 Reinsurance Solutions - Catastrophe Risk Analytics group. I advise clients on
25 catastrophe actuarial services, such as rate indications, rate filing strategy,

1 underwriting strategy, and use of catastrophe models in risk management. I am
2 responsible for Aon's compliance with ASOP 38 regarding use of catastrophe
3 models. I am a consulting actuary for Aon's in-house model Impact Forecasting,
4 LLC. I work with a group of catastrophe modelers to provide catastrophe
5 modeling support for reinsurance placements. Our client services include but are
6 not limited to support for multi-model analytics, customized view of risks,
7 catastrophe pricing, catastrophe risk selections, data augmentation, model
8 evaluation, real-time event response, portfolio optimization, actuarial support,
9 reinsurance cost allocations, and rating agency questionnaire support.

10

11 **Q. Describe your professional and educational background.**

12

13 A. I have been with Aon since September 2018. Prior to joining Aon, I worked at
14 State Farm Insurance Companies for over 17 years from 2001 to 2018 where I
15 led the catastrophe modeling functions since 2005. During my tenure at State
16 Farm, I was responsible for State Farm's use of catastrophe models in pricing,
17 underwriting, claims, reinsurance, securitization, enterprise risk managements,
18 and rating agency reporting.

19

20 I had 2 years of rate making experience as a pricing actuary for Homeowner lines
21 at State Farm. I am familiar with the development and implementation of
22 property insurance rates and rules. I understand the challenges for an insurer to
23 balance rate adequacy, competitiveness, and meet financial objectives at the
24 same time.

1

2 I have a Bachelor's degree in Biochemical Engineering from Beijing University of
3 Chemical Technology, a Master's degree in Chemistry from Eastern Illinois
4 University, and a Master's degree in Computer Science from the University of
5 Missouri - Columbia.

6

7 **Q. Are you a member of any professional actuarial organizations?**

8

9 A. Yes. I am a Fellow of the Casualty Actuarial Society (FCAS), and a Member
10 of the American Academy of Actuaries (MAAA). I am a Certified Catastrophe
11 Risk Management Professional (CCRMP), a new designation created by the
12 CAS Institute (iCAS) and International Society of Catastrophe Managers (ISCM).
13 I am currently serving on the Casualty Actuarial Society's Climate Change
14 Committee, American Academy of Actuaries' Extreme Event Risk Committee,
15 and on the advisory board for CCRMP designation. I am in good standing with
16 the requirements of all of these organizations.

17

18 I am part of a working group that authored the following monographs for the
19 American Academy of Actuaries:

- 20 • The National Flood Insurance Program: Challenges and Solutions (2017)
- 21 • Uses of Catastrophe Model Output (2018)
- 22 • Wildfire: An Issue Paper - Lessons Learned from the 2017–2018
23 California Events (2019)

1 I am one of the recipients of the Casualty Actuarial Society's Above and Beyond
2 Achievement Award in 2019 to recognize my leadership and contributions to
3 establish the CCRMP designation for the insurance industry.

4

5 **Q. Please describe your relevant experience and qualifications for this**
6 **proceeding.**

7

8 A. I started practicing in the catastrophe risk management field in 2005. During
9 my tenure at State Farm, I managed State Farm's catastrophe modeling function
10 from 2005 to 2018. I managed vendor relationships with AIR, EQECAT, ARA,
11 and RMS. I provided filing support and helped my employer through many
12 regulatory challenges related to the use of models in insurance operations. I
13 provided actuarial opinions on State Farm's use of catastrophe models. I
14 established the due diligence and model validation framework to ensure
15 catastrophe modeling practices at State Farm met the actuarial standards and
16 complied with laws and regulatory requirements. My team provided various
17 catastrophe risk measures and analytics for State Farm Fire and affiliates for rate
18 making, exposure management, claims, ERM, rating agency reporting,
19 reinsurance and securitization purposes.

20

21 From 2010 to 2013, I was a member of an advisory group to the Insurance
22 Bureau of Canada (IBC) and Office of the Superintendent of Financial Institutions
23 (OSFI) to provide expert opinions on insurance and the economic impact of

1 major earthquakes in Canada. From 2011 to 2013, I was a member of an
2 advisory group for IBC and OSFI to revise OSFI Guideline B-9 (Earthquake
3 Exposure Management Sound Practice Guideline for insurance companies). I
4 led a State Farm team to establish the compliance framework to meet OSFI B-9
5 regulation requirements.

6

7 In January 2015, I was appointed by Florida CFO Jeff Atwater to serve on the
8 Florida Commission on Hurricane Loss Projection Methodology (FCHLPM) as
9 the industry actuary. From January 2015 to September 2018, I represented the
10 property insurance industry on the FCHLPM to review and accept hurricane
11 models for use in ratemaking in the State of Florida. My term on the FCHLPM
12 ended in September 2018 due to my job change.

13

14 The hurricane models used for this rate filing, AIR Touchstone V7.3 and RMS
15 RiskLink V18.1, are both certified by FCHLPM.

16

17 **Q. Describe the role of Aon Reinsurance Solutions Analytics and**

18 **Catastrophe Risk Analytics.**

19

20 A. Aon Reinsurance Solutions Analytics (a.k.a Reinsurance Analytics) provides
21 consultative services to Aon's clients who place catastrophe reinsurance through
22 Aon. These clients are primary insurers selling property insurance products in
23 catastrophe prone areas. Aon Reinsurance Analytics provides value-added

1 service that is above and beyond reinsurance brokering transactions. Our client
2 services include but are not limited to support for multi-model analytics,
3 customized view of risks, catastrophe pricing, catastrophe risk selections, data
4 augmentation, model evaluation, real-time event response, portfolio optimization,
5 reinsurance cost allocations, actuarial support and rating agency questionnaire
6 support.

7

8 Within the Reinsurance Analytics division, there is a team specialized in
9 catastrophe risk analytics. I am part of the catastrophe risk analytics team that
10 provides clients with catastrophe risk management information and assists
11 clients with their reinsurance purchasing decisions.

12

13 **Q. Describe your experience with catastrophe models.**

14

15 A. From 2005 to 2006, I performed the catastrophe modeling analyst's role,
16 which includes hands-on experience with multiple models - from data preparation
17 to running the models, to post model aggregation. My daily work involved data
18 preparation and converting exposure data into model input files. I gained
19 knowledge about how different models handle building characteristics and
20 insurance terms. I used RMS RiskLink, AIR Clasic/2, and EQECAT models on a
21 daily basis. I developed an understanding of the models' back end database and
22 output. I performed post model analysis and wrote computer programs to
23 develop risk metrics such as PMLs, AALs, and TVaR to help State Farm assess
24 and manage catastrophe risks. Later in my career, I assembled a team and

1 delegated many modeling tasks to my colleagues. I stayed involved by providing
2 guidance and managing the day to day work of the catastrophe modeling unit.

3

4 **Q. Describe your experience with catastrophe reinsurance.**

5

6 A. My experience with reinsurance started in 2005 at State Farm. State Farm is
7 a reinsurance buyer and I was a part of the company's reinsurance buying team.
8 I supported the reinsurance function at multiple levels. My work included using
9 catastrophe model output and financial information to help my employer in
10 structuring reinsurance, conducting technical pricing, drafting and reviewing
11 reinsurance contracts, and participating in reinsurance buying trips. I evaluated
12 catastrophe risks and cost of capital from both ceding and assuming parties. I
13 worked closely with our reinsurance broker to validate our view of risks using
14 external benchmarks. At Aon, I work directly with our clients who are seeking to
15 purchase catastrophe reinsurance. Output from models is used by our brokers,
16 clients, and capital markets to determine the reinsurance structure and pricing.
17 We customize reinsurance solutions based on clients' risk appetite and risk
18 profile.

19

20 **Q. Do you speak on topics pertaining to catastrophe modeling?**

21

22 A. Yes. I have presented at CAS Ratemaking, Product and Modeling
23 Conferences. I am a frequent speaker at Reinsurance Association of America's
24 annual catastrophe modeling conference. My topics have included model

1 blending, model regulation, and wildfire modeling, among others. From 2012 to
2 2018, I was a visiting instructor for the Illinois State University Math Department
3 Actuarial Science program. I presented catastrophe modeling and regulatory
4 topics to actuarial students. From 2016 to 2018, I was a member of the planning
5 committee for the Reinsurance Association of America's annual catastrophe
6 modeling conference. I organized and moderated panels and engaged speakers
7 to cover a variety of catastrophe topics.

8

9 **Q. You already have other prefiled testimony in this filing, do you not?**

10

11 A. Yes. My other testimony is contained in Exhibits RB-7, RB-8, RB-9, and RB-
12 10 and pertains generally to the development of the modeled hurricane losses
13 used in this filing.

14

15 **Q. Would you please explain the circumstances leading to your providing**
16 **this testimony?**

17

18 A. Yes. My colleague Stephen Fiete led the Aon team that developed the
19 provisions for the net cost of reinsurance used in this filing, and he provided the
20 original testimony in this filing regarding that work. Mr. Fiete resigned from Aon
21 effective March 15, 2021, and I was chosen to step into his place in terms of
22 providing testimony regarding the development of the provisions for the net cost
23 of reinsurance. I am very familiar with the methodologies and results of that
24 work. I have reviewed Mr. Fiete's testimony on behalf of Aon regarding those
25 methodologies and the results of that work, and I approve and adopt that

1 testimony. Therefore, the remainder of my testimony here is substantively the
2 same as the corresponding portions of Mr. Fiete's testimony.

3

4 **Q. What was your role in this filing with respect to expected catastrophe**
5 **losses?**

6

7 A. I worked with an Aon Reinsurance Analytics team to determine an appropriate
8 provision for the net cost of reinsurance for the state overall and an allocation of
9 that cost by territory. The provision used exposure data from all the risks in the
10 state so that a cost provision would be appropriate to use in a uniform rate
11 schedule applicable to all insurers in the state.

12

13 **Q. What is catastrophe reinsurance, who buys it, and why do they buy it?**

14

15 A. Catastrophe reinsurance is a contract purchased by a primary insurance
16 company and sold by a reinsurer, or a group of reinsurers, to transfer risk from
17 loss due to large catastrophic events. The most common type of contract used
18 for catastrophe risk is called "Portfolio Excess of Loss", a.k.a. "Portfolio XOL", or
19 just "XOL". A single XOL contract has an "attachment" and a "limit". An XOL
20 covers the amount of portfolio loss caused by a single event in the amount which
21 exceeds the XOL attachment with a maximum equal to the XOL limit. In some
22 instances, there is co-participation, which means that only a percentage of the
23 amount of loss in the XOL layer is covered. Portfolio XOL contracts (a.k.a.
24 "treaties" since there are typically multiple reinsurers involved) cover the first

1 event within a year of coverage. It is standard practice to write into the treaty a
2 provision for the primary carrier to automatically purchase a “reinstatement” if
3 they have a loss which triggers a reinsurance payment. The reinstatement
4 premium allows for the full limit to be reinstated after the first event uses up the
5 limit provided. There are cases where a limit is provided and if an event exhausts
6 that limit, then there is no coverage available for the remainder of the contract
7 period. It is typical of primary carriers to buy multiple treaties that stack on top of
8 each other. In other words, a treaty will have an attachment equal to the
9 attachment plus limit of another treaty. Primary carriers buy reinsurance to
10 ensure the company is financially viable after very large and uncommon to rare
11 events.

12

13 **Q. Are catastrophe simulation models commonly used by insurers for**
14 **ratemaking in catastrophe-exposed lines and jurisdictions?**

15

16 A. Yes, catastrophe models have become the standard method of estimating
17 catastrophe risk in rate filings and reinsurance. I have provided data and analysis
18 for Aon clients to use in their rate filings in multiple states.

19

20 **Q. What is demand surge?**

21

22 A. Demand surge is a social economic phenomenon defined by the Actuarial
23 Standards Board as ‘a sudden and usually temporary increase in the cost of

1 materials, services and labor due to the increased demand for them following a
2 catastrophe.’ Demand surge usually occurs after large-scale disasters such as
3 earthquakes, tsunamis, cyclones or flooding. The models incorporate demand
4 surge into their loss estimates.

5

6 **Q. Should model output include demand surge?**

7

8 A. All applications of catastrophe model output should reflect demand surge.

9 Demand surge is a real social economic phenomenon. Insurance companies’
10 claims experience includes the effect of demand surge. Excluding demand surge
11 would underestimate catastrophe losses.

12

13 **Q. Does any state prohibit the inclusion of demand surge in modeled**
14 **losses for rate filings?**

15

16 A. I am not aware of any prohibitions against the use of demand surge in rate
17 filings in any jurisdiction. The South Carolina Department of Insurance Bulletin
18 2014-03 states “Demand surge may be included in the modeled results as long
19 as the company provides the impact it has on the modeled losses.” The Florida
20 Commission on Hurricane Loss Projection Methodologies’ actuarial standards
21 require hurricane models to incorporate demand surge based on relevant data
22 and actuarially sound methods and assumptions.

23

1 **Q. North Carolina has laws prohibiting “price gouging” following a**
2 **hurricane. Does that eliminate demand surge?**

3

4 A. No. Florida has a similar law (Title XXXIII 501.160). Demand surge can and
5 does occur due to supply and demand economics in situations that would not be
6 considered price gouging and/or that would not be prevented by statutes
7 prohibiting price gouging.

8

9 **Q. Does it make sense for North Carolina hurricane losses to include**
10 **demand surge for very large events impacting other states even if those**
11 **events were less significant in North Carolina?**

12

13 A. Yes, the intent of the model is to reflect economic conditions that will influence
14 construction prices and other aspects of insured loss (such as, for example, the
15 increased period of time a carrier has to pay for hotel rooms for insureds while
16 their damaged homes are repaired) in the time period shortly after a catastrophe
17 event occurs. Since labor and materials resources are exchanged by people
18 across state lines, we believe the demand surge effect on prices in other states
19 will have an effect in North Carolina.

20

21 **Q. Are you aware of how the reinsurance program was designed and priced**
22 **for purposes of this rate filing? Do you think it is reasonable?**

23

1 A. Yes, the Aon Reinsurance Analytics team designed the reinsurance program
2 for this rate filing. The basis of the reinsurance program structure and pricing is
3 determined by an analysis of reinsurance programs placed by Aon for its
4 reinsurance clients. Three components of the analysis are described here.

5

6 **Program attachment and total limit** describes the total amount of reinsurance
7 coverage. Since companies vary substantially in size, so does their limit
8 purchase and attachment for their bottom layers. To normalize for company size,
9 we looked at the frequency with which a single event would trigger a recovery
10 and the frequency with which a single event would exhaust the limit of the entire
11 program for each company. This was calculated separately for the AIR and the
12 RMS models. We then calculated the median attachment and exhaustion
13 (exhaustion = bottom layer attachment + total program limit) frequencies by
14 model and by region (Southeast and Nationwide). The frequencies for
15 attachment and exhaustion were averaged across the regions, which resulted in
16 attachment and exhaustion frequency by model. Using portfolio loss and LAE
17 distributions by model for the portfolio in the filing, we calculated the dollar
18 amount of attachment and exhaustion (and therefore limit) by model. The loss
19 distributions come from the AIR 7.3 and RMS 18.1 catastrophe models, and the
20 LAE is based on an analysis of data which is summarized in Exhibit RB-14. The
21 attachment of the reinsurance program in the filing is the average of the AIR
22 indicated attachment and RMS indicated attachment. The exhaustion of the

1 reinsurance program in the filing is the average of the AIR indicated exhaustion
2 and the RMS indicated exhaustion.

3

4 **Reinsurance Market Pricing Model** For AIR and RMS, log-linear regression
5 models were built to calculate fitted reinsurance price based on modeled
6 expected ceded loss and LAE. Using these regression models, an indicated price
7 for any layer can be calculated based on each catastrophe model (AIR and
8 RMS). The selected prices by layer used in this rate filing are the averages of the
9 AIR indicated prices and the RMS indicated prices.

10

11 Note: Because insight into reinsurance market pricing is an important proprietary
12 asset for Aon, the log-linear models are considered a trade secret and therefore
13 not disclosed in this public filing.

14

15 **Program Structure** After the program attachment and limit are determined and
16 the market pricing model is determined, we break up the program limit into
17 layers. We run an optimization analysis which finds the five-layer cat program
18 that has the lowest possible total program reinsurance premium. In the prior
19 filing, we looked at the ratio of standard deviation of ceded loss and LAE to limit
20 by layer and selected breakpoints. The method this year removes subjectivity
21 and is designed to calculate an indicated reinsurance premium that is as low as
22 possible, subject to the market pricing model and program attachment and limit
23 specifications.

1

2 The reinsurance structure determined by the method described above is shown
3 in Exhibit RB-12. The pricing with loss analysis is shown in Exhibit RB-13.

4

5 **Q. How was the reinsurance premium allocated?**

6

7 A. Reinsurance premium by layer is allocated to a territory based on that
8 territory's share of expected ceded loss and loss adjustment expense by layer.
9 Exhibit RB-13 shows the total expected ceded loss and LAE by layer and Exhibit
10 RB-15 shows the proportion of hurricane peril reinsurance premium, ceded
11 average annual loss, and reinsurance margin (a.k.a. "net cost of reinsurance")
12 allocated to each territory segment for each layer. Other perils were used in the
13 calculation, but because they contributed such a small amount of expected
14 ceded loss and LAE they were not shown on the exhibits. Exhibit RB-16 shows
15 the dollar amount of reinsurance margin allocated by territory.

16

17 **Q. How was the net cost of reinsurance calculated?**

18

19 A. Net cost of reinsurance is Deposit Premium + Expected Reinstatement
20 Premium - Expected Ceded Loss & LAE. The reinsurance program, the loss
21 distribution from the portfolio as determined by event loss tables (ELTs) from cat
22 models and the LAE assumptions are input into a DFA (Dynamic Financial
23 Analysis) program to calculate the average ceded loss and LAE and average
24 reinstatement premium over a specified number of simulated years. The loss

1 distribution which is produced by the AIR model is already in the form of
2 simulated loss experience for 100,000 years. The DFA program calculates for
3 each year the total reinsurance recoveries and reinstatement premium paid. The
4 program then calculates the average annual ceded loss & LAE, and the average
5 reinstatement premium. The loss distribution from RMS models is a list of
6 possible catastrophic events. Instead of providing specific year and amount of
7 loss from each event, each event has a parametric distribution for frequency and
8 severity. The DFA program creates a simulation of 1,000,000 years of loss
9 experience to make a table containing year, event id, and specific amount of
10 loss. From that point the calculation works the same as the AIR model.

11

12 For the NCRB filing, our analysis shows that expected premium is \$42,276,777,
13 expected ceded loss & LAE is \$12,361,030, and the net cost of reinsurance is
14 \$29,915,747, as shown on Exhibit RB-16 and the summary on Exhibit RB-13.
15 Allocation by territory is done using the method described above.

16

17 **Given your experience in catastrophe reinsurance, do you find this**

18 **approach to be reasonable?**

19 A. Yes. Aon's approach is based on detailed information on current reinsurance
20 market rates and underlying model output.

21

22 **Q. Do you know whether the Rate Bureau has used in its 2021 Mobile Home**
23 **filing the net cost of reinsurance results Aon provided?**

24

1 A. Yes, I am advised that the Rate Bureau has used in the filing both our
2 statewide net cost of reinsurance results and those results allocated to the
3 territory level.

4

5 **Q. Are you aware of the provisions in the North Carolina statutes, in**
6 **N.C.G.S. 58-36-10(7), that state:**

7 *Property insurance rates established under this Article may include a*
8 *provision to reflect the cost of reinsurance to protect against catastrophic*
9 *exposure within this State. Amounts to be paid to reinsurers, ceding*
10 *commissions paid or to be paid to insurers by reinsurers, expected*
11 *reinsurance recoveries, North Carolina exposure to catastrophic events*
12 *relative to other states' exposure, and any other relevant information may*
13 *be considered when determining the provision to reflect the cost of*
14 *reinsurance.*

15

16 A. Yes. I am. This NC statute provision is consistent with ASOP 53, Estimating
17 Future Costs of Prospective Property/Casualty Risk Transfer and Risk Retention,
18 which “applies to actuaries when performing actuarial services with respect to
19 developing or reviewing future cost estimates (commonly known as actuarial
20 indications) for prospective property/casualty risk transfer and risk retention. For
21 example, this standard applies when actuaries are developing future cost
22 estimates underlying product prices, estimating funding requirements for self-
23 insured programs and captives, and developing reinsurance prices.”

24

1 **Q. Do you have an opinion whether the analysis you and Aon have**
2 **performed on behalf of the Rate Bureau on the net cost of reinsurance for**
3 **this filing has taken into consideration the provisions of that statute?**
4

5 A. Yes. Based on my experience with hurricane models and using modeled
6 hurricane losses and my experience with catastrophe reinsurance and
7 determining catastrophe reinsurance costs for rate filings, it is my opinion that the
8 analysis we have performed on the net cost of reinsurance for this filing properly
9 considers all of the items set out in that statute. Further, it is my opinion based on
10 my experience analyzing property-catastrophe reinsurance programs that a
11 reasonable and appropriate provision for the net cost of reinsurance must be
12 incorporated into Mobile Home insurance rates in North Carolina in order for
13 those rates to properly reflect and protect against the catastrophe exposure in
14 this state.

15
16 **Q. Do you have an opinion regarding the appropriateness of the net cost of**
17 **reinsurance provision incorporated into this filing?**
18

19 A. Yes. Based on my experience with hurricane models and using modeled
20 hurricane losses and my experience with catastrophe reinsurance and
21 determining catastrophe reinsurance costs for rate filings, it is my opinion that the
22 provision for the net cost of reinsurance in the filing, at the statewide and territory
23 levels, is reasonable and appropriate.
24

1 **Q. Does that conclude your testimony?**

2

3 A. Yes.

4

Total		41,042,500	1,234,277	42,276,777	12,361,030	29,915,747

The table above shows indicated rates-on-line for the filing's reinsurance structure along with analysis of modeled catastrophe losses. Rate-on-Line values have been selected using the current Loss-On-Line approach, which is a benchmarking analysis done using reinsurance treaties placed by Aon.

Deposit Premium is Rate-On-Line * Layer Limit

Expected Ceded Loss and Expected Reinstatement premium are the average annual amounts of each based on a simulation of catastrophe losses subject to the reinsurance program.

Expected Total Premium = Deposit Premium + Expected Reinstatement Premium

Net Cost of Reinsurance = Expected Total Premium - Expected Ceded Loss

North Carolina Rate Bureau Mobile Home Insurance Rate Filing Support for Selected Catastrophe LAE Factor

This chart shows Catastrophe LAE factors applied to modeled catastrophe event losses in AM Best SRQ Submissions by Aon clients in 2019.

- Factors were rounded to the nearest 0.5
- A weighted average was used where factors varied by peril
- Multiple factors were counted where factors varied by company within a group
- Reflects all clients that included a provision for LAE

The mean factor is 6.8, the median is 6.0, and the mode is 3.0.

PREFILED TESTIMONY
OF
JAMES H. VANDER WEIDE

2021 MOBILE HOME
INSURANCE RATE FILING
BY THE NORTH CAROLINA RATE BUREAU

Q. WHAT IS YOUR NAME, OCCUPATION, AND BUSINESS ADDRESS?

A. My name is James H. Vander Weide. I am President of Financial Strategy Associates, a firm that provides strategic and financial consulting services to corporate clients. My business address is 3606 Stoneybrook Drive, Durham, North Carolina 27705.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND PRIOR ACADEMIC EXPERIENCE.

A. I graduated from Cornell University with a bachelor's degree in economics and then attended Northwestern University where I earned a Ph.D. in Finance. I joined the faculty of the School of Business at Duke University where I was subsequently named Assistant Professor, Associate Professor, Professor, and Research Professor. I have published research in the areas of finance and economics and taught courses in these fields at Duke for more than thirty-five years. I am now retired from my teaching duties at Duke.

I have taught courses in corporate finance, investment management, and management of financial institutions. I also taught a graduate seminar on the theory of public utility pricing and lectured in executive development seminars on

the cost of capital, financial analysis, capital budgeting, mergers and acquisitions, cash management, short-run financial planning, and competitive strategy.

I have served as Program Director and taught in numerous executive education programs at Duke, including the Duke Advanced Management Program, the Duke Management Challenge, the Duke Executive Program in Telecommunications, Competitive Strategies in Telecommunications, and the Duke Program for Manager Development for managers from the former Soviet Union. I have also taught in tailored programs developed for corporations such as ABB, Accenture, Allstate, AT&T, Progress Energy, GlaxoSmithKline, Lafarge, MidAmerican Energy, Norfolk Southern, The Rank Group, Siemens, TRW, and Wolseley PLC.

In addition to my teaching and executive education activities, I have written research papers on such topics as portfolio management, the cost of capital, capital budgeting, the effect of regulation on the performance of public utilities, and cash management. My articles have been published in *American Economic Review*, *Financial Management*, *International Journal of Industrial Organization*, *Journal of Finance*, *Journal of Financial and Quantitative Analysis*, *Journal of Bank Research*, *Journal of Accounting Research*, *Journal of Cash Management*, *Management Science*, *The Journal of Portfolio Management*, *Atlantic Economic Journal*, *Journal of Economics and Business*, and *Computers and Operations Research*. I have written a book titled *Managing Corporate Liquidity: an Introduction to Working Capital Management*, a chapter for *The Handbook of*

Modern Finance, “Financial Management in the Short Run,” and a chapter for the book, *The Handbook of Portfolio Construction: Contemporary Applications of Markowitz Techniques*, “Principles for Lifetime Portfolio Selection: Lessons from Portfolio Theory.”

Q. HAVE YOU PREVIOUSLY PRESENTED EVIDENCE ON THE COST OF CAPITAL AND OTHER REGULATORY ISSUES?

A. Yes. As an expert on financial and economic theory and practice, I have participated in more than five hundred regulatory and legal proceedings before the public service commissions of forty-five states and four Canadian provinces, the Federal Energy Regulatory Commission, the National Energy Board (Canada), the Federal Communications Commission, the Canadian Radio-Television and Telecommunications Commission, the United States Congress, the National Telecommunications and Information Administration, the insurance commissions of five states, the Iowa State Board of Tax Review, the National Association of Securities Dealers, and the North Carolina Property Tax Commission. In addition, I have prepared expert testimony in proceedings before the United States District Court for the District of Nebraska; the United States District Court for the District of New Hampshire; the United States District Court for the District of Northern Illinois; the United States District Court for the Eastern District of North Carolina; the Montana Second Judicial District Court, Silver Bow County; the United States District Court for the Northern District of California; the Superior Court, North Carolina; the United States Bankruptcy Court for the Southern District of West Virginia; the United States District Court

for the Eastern District of Michigan; and the Supreme Court of the State of New York.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I have been asked by the North Carolina Rate Bureau to make an independent appraisal of the aggregate cost of equity capital for the companies writing mobile home insurance in North Carolina and to recommend a rate of return on equity that is fair, that allows those companies in the aggregate to attract and retain capital on reasonable terms, that is commensurate with returns on investments of comparable risk, and that maintains the financial integrity of those companies in the aggregate.

Q. WHAT DO YOU MEAN BY THE PHRASE "COST OF EQUITY CAPITAL?"

A. A firm's cost of equity capital is the rate of return expectation that is required in the marketplace on equity investments of comparable risk. If an investor does not expect to earn a return on an equity investment in a firm that is at least as large as the return the investor could expect to earn on other investments of comparable risk, then the investor will not invest in that firm's shares. Thus, a firm's cost of equity capital is also the rate of return expectation that is required in the marketplace in order to induce equity investors to purchase shares in that firm.

Q. IS THE COST OF EQUITY CAPITAL THE SAME AS THE RETURN ON EQUITY?

A. No. The cost of equity capital is a market-based concept that reflects investors' future expectations, while the return on equity is an accounting concept that measures results of past performance. The return on equity is equal to income available for common equity divided by the book value of common equity.

Q. HAVE YOU FORMED AN OPINION REGARDING THE COST OF EQUITY CAPITAL FOR THE AVERAGE COMPANY WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA?

A. Yes.

Q. WHAT IS YOUR OPINION IN THAT REGARD?

A. The cost of equity capital for such a company is in the range 7.5 percent to 10.7 percent.

Q. WHAT ECONOMIC PRINCIPLES DID YOU CONSIDER IN ARRIVING AT THAT OPINION?

A. There are two primary economic principles relevant to my appraisal of the cost of equity capital. The first, relating to the demand for capital, states that a firm should continue to invest in its business only so long as the return on its investment is greater than or equal to its cost of capital. In the context of a regulated firm, this principle suggests that the regulatory agency should establish revenue levels which will offer the firm an opportunity to earn a return on its investment that is at least equal to its cost of capital.

The second principle, relating to the supply of capital, states that rational investors are maximizing their total return on capital only if the returns they expect to receive on investments of comparable risk are equal. If these returns are not equal, rational investors will reduce or completely eliminate investments in those activities yielding lower expected returns for a given level of risk and will increase investments in those activities yielding higher expected returns. The second principle implies that regulated firms will be unable to obtain the capital required to expand service on reasonable terms unless they are able to provide investors returns equal to those expected on investments of comparable risk.

Q. DO THESE ECONOMIC PRINCIPLES APPLY TO THE SETTING OF INSURANCE RATES?

A. Yes. These are general economic principles that apply to investing in any business activity, including insurance.

Q. HOW DID YOU GO ABOUT DETERMINING THE COST OF EQUITY CAPITAL FOR THE AVERAGE COMPANY WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA?

A. I used two generally accepted methods to estimate the cost of equity: (1) the Discounted Cash Flow (DCF) Model, and (2) the Risk Premium Approach.

Q. PLEASE DESCRIBE THE DCF MODEL.

A. The DCF Model suggests that investors value an asset on the basis of the future cash flows they expect to receive from owning the asset. Thus, investors value

an investment in a bond because they expect to receive a sequence of coupon payments over the life of the bond and a terminal payment equal to the bond's face value at the time the bond matures. Likewise, investors value an investment in a firm's stock because they expect to receive a sequence of dividend payments and, perhaps, expect to sell the stock at a higher price sometime in the future.

A second fundamental principle of the DCF approach is that investors value a dollar received in the future less than a dollar received today. A future dollar is valued less than a current dollar because investors could invest a current dollar in an interest earning account and increase their wealth. This principle is called the time value of money.

Applying the two fundamental DCF principles noted above to an investment in a bond suggests that investors should value their investment in the bond on the basis of the present value of the bond's future cash flows. Thus, the price of the bond should be equal to:

Equation 1

$$P_B = \frac{C}{(1+i)} + \frac{C}{(1+i)^2} + \dots + \frac{C+F}{(1+i)^n}$$

where:

- P_B = Bond price;
- C = Cash value of the coupon payment (assumed for notational convenience to occur annually);
- F = Face value of the bond;

- i = The rate of interest the investor could earn by investing his money in an alternative bond of equal risk; and
n = The number of periods before the bond matures.

Applying these same principles to an investment in a firm's stock suggests that the price of the stock should be equal to:

Equation 2

$$P_s = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_n + P_n}{(1+k)^n}$$

where:

- P_s = Current price of the firm's stock;
 $D_1, D_2 \dots D_n$ = Expected annual dividend per share on the firm's stock;
 P_n = Price per share of stock at the time the investor expects to sell the stock; and
k = Return the investor expects to earn on alternative investments of the same risk, i.e., the investor's required rate of return.

Equation (2) is frequently called the Annual Discounted Cash Flow (DCF) Model of stock valuation.

Q. HOW DO YOU USE THE DCF MODEL TO DETERMINE THE COST OF EQUITY CAPITAL?

A. The "k" in the equation is the cost of equity capital. We make certain simplifying assumptions regarding the other factors in the equation and then mathematically solve for "k."

Q. WHAT ARE THE ASSUMPTIONS YOU MAKE?

A. Most analysts make three simplifying assumptions. First, they assume that dividends are expected to grow at the constant rate (“g”) into the indefinite future. Second, they assume that the stock price at time “n” is simply the present value of all dividends expected in periods subsequent to “n.” Third, they assume that the investors’ required rate of return, “k,” exceeds the expected dividend growth rate, “g.”

Q. DOES THE ANNUAL DCF MODEL OF STOCK VALUATION PRODUCE APPROPRIATE ESTIMATES OF A FIRM’S COST OF EQUITY CAPITAL?

A. No. The Annual DCF Model of stock valuation produces appropriate estimates of a firm’s cost of equity capital only if the firm pays dividends just once a year. Because most firms pay dividends quarterly, the Annual DCF Model produces downwardly biased estimates of the cost of equity. Investors can expect to earn a higher annual effective return on an investment in a firm that pays quarterly dividends than in one which pays the same amount of dollar dividends once at the end of each year. A complete analysis of the implications of the quarterly payment of dividends on the DCF Model is provided in Exhibit RB-20. For the reasons cited there, I employed the Quarterly DCF Model throughout my calculations.

Q. PLEASE DESCRIBE THE QUARTERLY DCF MODEL YOU USED.

A. The Quarterly DCF Model I use is described by Equation 10 on page 10 in Exhibit RB-20. This equation shows that the cost of equity is equal to the sum of the dividend yield and the growth rate, where the dividend in the dividend yield is

the equivalent dividend at the end of the year, and the growth rate is the expected growth in dividends or earnings per share.

Q. HOW DO YOU APPLY THE DCF APPROACH TO OBTAIN THE COST OF EQUITY CAPITAL FOR THE COMPANIES WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA?

A. I apply the DCF approach to two groups of companies: Value Line's group of property/casualty insurance companies and the S&P 500.

Q. WHY DO YOU APPLY THE DCF APPROACH TO THE S&P 500 AS WELL AS TO VALUE LINE'S PROPERTY/CASUALTY INSURANCE COMPANIES?

A. As I noted previously, the cost of equity is defined as the rate of return investors expect to earn on investments in other companies of comparable risk. I apply the DCF approach to the S&P 500 because they are a large group of companies that, on average, are typically viewed as being comparable in risk to the property/casualty insurance industry. The use of a larger set of comparable risk companies should provide an accurate estimate of the cost of equity for the companies writing mobile home insurance in North Carolina.

Q. DO YOU INCLUDE ALL THE VALUE LINE PROPERTY/CASUALTY INSURANCE COMPANIES?

A. No. Among the Value Line property/casualty insurance companies, I only include companies which pay a quarterly dividend, have not lowered their dividends, and have a positive five-year earnings growth forecast available from I/B/E/S

(formerly known as the Institutional Brokers Estimate System, now published by Refinitiv). The Value Line property/casualty companies I use are shown in Exhibit RB-18.

Q. WHY DO YOU ELIMINATE ANY VALUE LINE PROPERTY/CASUALTY INSURANCE COMPANY WHICH HAS RECENTLY LOWERED ITS DIVIDEND OR WHICH FAILS TO PAY DIVIDENDS?

A. I eliminate those companies because it is difficult to make a reliable estimate of the future dividend growth rate for companies that have recently lowered their dividends or do not pay dividends. If a company has recently lowered its dividend, investors do not know whether the company will again lower its dividend in the future, or whether the company will attempt to increase its dividend back toward its previous level. If a company does not pay a dividend, one cannot mathematically apply the DCF approach.

Q. WHAT CRITERIA DO YOU USE TO SELECT COMPANIES IN THE S&P 500?

A. I include those firms which pay dividends and which have a long-term earnings growth forecast from I/B/E/S. Because I have already calculated DCF results for the Value Line property/casualty insurance companies, I exclude companies in the S&P 500 that are categorized as insurance companies by I/B/E/S Refinitiv. The S&P 500 companies I use are shown in Exhibit RB-19.

Q. HOW DO YOU ESTIMATE THE GROWTH COMPONENT OF THE QUARTERLY DCF MODEL?

A. I use the average of analysts' estimates of future earnings per share (EPS) growth reported by I/B/E/S. As part of their research, financial analysts working at Wall Street firms periodically estimate EPS growth for each firm they follow. The EPS forecasts for each firm are then published. The forecasts are used by investors who are contemplating purchasing or selling shares in individual companies.

Q. WHAT IS I/B/E/S?

A. I/B/E/S is a collection of analysts' forecasts for a broad group of companies expressed in terms of a mean forecast and a standard deviation of forecast for each firm. The mean forecast is used by investors as an estimate of future firm performance.

Q. WHY DO YOU USE THE I/B/E/S GROWTH ESTIMATES?

A. The I/B/E/S growth rates (1) are widely circulated in the financial community, (2) include the projections of reputable financial analysts who develop estimates of future growth, (3) are reported on a timely basis to investors, and (4) are widely used by institutional and other investors. For these reasons, I believe these estimates represent unbiased estimates of investors' expectations of each firm's long-term growth prospects and, accordingly, are incorporated by investors into their return requirements. Consequently, in my opinion, they provide the best available estimate of investors' long-term growth expectations.

Q. WHY DO YOU RELY EXCLUSIVELY ON ANALYSTS' PROJECTIONS OF FUTURE EPS GROWTH IN ESTIMATING THE INVESTORS' EXPECTED GROWTH RATE RATHER THAN LOOKING AT PAST HISTORICAL GROWTH RATES?

A. There is considerable empirical evidence that analysts' forecasts are more highly correlated with stock prices than are firms' historical growth rates, and, thus, that investors actually use these forecasts.

Q. HAVE YOU PERFORMED ANY STUDIES CONCERNING THE USE OF ANALYSTS' FORECASTS AS THE BEST ESTIMATE OF INVESTORS' EXPECTED GROWTH RATE, G?

A. Yes, I prepared a study with Willard T. Carleton, Professor of Finance Emeritus at the University of Arizona, on why analysts' forecasts provide the best estimate of investors' expectations of future long-term growth. This study is described in a paper entitled "Investor Growth Expectations: Analysts vs. History," published in *The Journal of Portfolio Management*.

Q. PLEASE SUMMARIZE THE RESULTS OF YOUR STUDY.

A. First, we performed a correlation analysis to identify the historically-oriented growth rates which best described a firm's stock price. Then we did a regression study comparing the historical growth rates with the consensus analysts' forecasts. In every case, the regression equations containing the average of analysts' forecasts statistically outperformed the regression equations containing the historical growth estimates. These results are consistent with those found by

Cragg and Malkiel, the early major research in this area. These results are also consistent with the hypothesis that investors use analysts' forecasts, rather than historically-oriented growth calculations, in making buy and sell decisions. They provide overwhelming evidence that the analysts' forecasts of future growth are superior to historically-oriented growth measures in predicting a firm's stock price.

Q. WHAT PRICE DO YOU USE IN YOUR DCF MODEL?

A. I use a simple average of the monthly high and low stock prices for each firm for the three-month period, August, September, and October 2020. These high and low stock prices are obtained from Refinitiv.

Q. WHY DO YOU USE THE THREE-MONTH AVERAGE STOCK PRICE, P_0 , IN APPLYING THE DCF METHOD?

A. I use a three-month average stock price in applying the DCF method because stock prices fluctuate daily, while financial analysts' forecasts for a given company are generally changed less frequently, often on a quarterly basis. Thus, to match the stock price with an earnings forecast, it is appropriate to average stock prices over a three-month period.

Q. PLEASE EXPLAIN YOUR INCLUSION OF FLOTATION COSTS.

A. All firms that have sold securities in the capital markets have incurred some level of flotation costs, including underwriters' commissions, legal fees, printing expense, etc. These costs are paid from the proceeds of the stock sale and

must be recovered over the life of the equity issue. Costs vary depending upon the size of the issue, the type of registration method used and other factors, but in general these costs range between four percent and five percent of the proceeds from the issue. In addition to these costs, the underwriter's offer price is set below the most recent closing price before the public offering in order to reduce the risk that the underwriters will be unable to sell the entire offering at the offer price. The difference between the offer price and the recent closing price is generally in the range two percent to three percent. Thus, the total flotation cost, including both issuance expense and underwriter discount, could range anywhere from five percent to eight percent of the proceeds of an equity issue. These cost ranges have been developed and confirmed in a number of generally accepted studies. I believe a combined five percent allowance for flotation costs is a conservative estimate that should be used in applying the DCF model in this proceeding.

Q. PLEASE SUMMARIZE THE RESULTS OF YOUR APPLICATION OF THE DCF METHOD TO THE PROPERTY/CASUALTY INSURANCE COMPANIES AND THE S&P 500.

A. As shown in Exhibits RB-18 and RB-19, the average DCF cost of equity capital for my group of Value Line property/casualty companies is 8.9 percent; and for the S&P 500 companies, the average DCF cost of equity is 10.7 percent.

Q. WHAT CONCLUSION DO YOU REACH FROM YOUR DCF ANALYSIS ABOUT THE COST OF EQUITY CAPITAL FOR COMPANIES WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA?

A. On the basis of my DCF analysis, I would conclude that for companies writing mobile home insurance in North Carolina the cost of equity is in the range 8.9 percent to 10.7 percent.

Q. YOU NOTE THAT THE SECOND METHOD YOU USE TO ESTIMATE THE COST OF EQUITY CAPITAL FOR COMPANIES WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA IS A RISK PREMIUM APPROACH. PLEASE DESCRIBE THAT APPROACH.

A. I perform a study of the comparable returns received by bond and stock investors over the last 94 years. I estimate the returns on stock and bond portfolios, using stock price and dividend yield data on the S&P 500 stock portfolio and bond yield data on Moody's A-rated utility bonds.

My study consists of analyzing the historically achieved returns on broadly based stock and bond portfolios going back to 1926. For stocks, I use the S&P 500 stock portfolio; and for bonds, I use Moody's A-rated utility bonds. The resulting annual returns on the stock and bond portfolios purchased in each year from 1926 through 2019 are shown on Exhibit RB-21. The difference between the stock return and the bond return over that period of time on an arithmetic average basis is 4.7 percentage points.

Q. WHAT CONCLUSIONS DO YOU DRAW FROM YOUR RISK PREMIUM ANALYSES?

A. My own studies, combined with my analysis of other studies, provide strong evidence for the belief that investors today require an equity return of at least

4.7 percentage points above the expected yield on A-rated long-term debt issues.

The average yield on Moody's seasoned A-rated utility bonds for the three months August through October 2020 was 2.8 percent. On the basis of this information and my knowledge of bond market conditions, I conclude that the long-term yield on A-rated utility bonds is approximately 2.8 percent. Adding a 4.7 percentage point risk premium to the 2.8 percent average yield on A-rated utility bonds, I obtain a return on equity of 7.5 percent from my ex post risk premium analysis.

Q. ARE THERE REASONS TO BELIEVE THAT THE RESULT OF YOUR EX POST RISK PREMIUM ANALYSIS MAY UNDERESTIMATE THE COST OF EQUITY AT THIS TIME?

A. Yes. The ex post risk premium model may produce an unrealistically low result because the model result is highly sensitive to the estimate of the bond yield. At this time, bond yields are unusually low, reflecting policy decisions of the United States government and the Federal Reserve Bank to keep interest rates low in order to stimulate the economy. The ex post risk premium cost of equity result is the sum of the risk premium and the bond yield; and, as a result, the use of an unusually low bond yield in the model may cause the ex post risk premium model result to underestimate the cost of equity.

Q. BASED ON YOUR ANALYSES, WHAT IS YOUR OPINION AS TO THE COST OF EQUITY CAPITAL FOR THE AVERAGE INSURANCE COMPANY WRITING MOBILE HOME INSURANCE IN NORTH CAROLINA?

A. Based on my review and studies, I believe that a conservative estimate of the cost of common equity capital for the average insurance company writing mobile home insurance in North Carolina is in the range 7.5 percent to 10.7 percent.

SUMMARY OF DISCOUNTED CASH FLOW ANALYSIS FOR
PROPERTY/CASUALTY INSURANCE COMPANIES

	COMPANY	MOST RECENT QUARTERLY DIVIDEND (d ₀)	STOCK PRICE (P ₀)	FORECAST OF FUTURE EARNINGS GROWTH	DCF MODEL RESULT
1	Allstate Corp.	0.540	93.485	8.21%	10.8%
2	Amer. Financial Group	0.500	68.245	2.09%	5.0%
3	Berkley (W.R.)	0.120	62.690	9.57%	10.4%
4	Chubb Ltd.	0.780	124.542	6.43%	9.2%

10	Travelers Cos.	0.850	115.862	4.48%	7.7%
11	Average				8.9%

Note:

- d₀ = Latest quarterly dividend.
d₁, d₂, d₃, d₄, = Expected next four quarterly dividends, calculated by multiplying the last four quarterly dividends per Value Line, by the factor (1 + g).
P₀ = Average of the monthly high and low stock prices during the three months ending October 2020 per Refinitiv.
FC = Flotation costs.
g = Forecast of future earnings growth October 2020.
k = Cost of equity using the quarterly version of the DCF Model and a five percent allowance for flotation costs as shown by the formula below:

$$k = \frac{d_1(I + k)^{75} + d_2(I + k)^{50} + d_3(I + k)^{25} + d_4}{P_0(I - FC)} + g$$

Note: In applying the DCF Model to the S&P 500, I include in the DCF analysis all non-insurance companies in the S&P 500 group which pay a dividend and have an available positive analyst long-term growth estimate.

- D₀ = Latest dividend per Refinitiv.
d₀ = Latest quarterly dividend.
P₀ = Average of monthly high and low stock prices August, September, and October 2020 per Refinitiv.
FC = Selling and flotation costs.
g = I/B/E/S forecast of future earnings growth October 2020.
k = Cost of equity using the quarterly version of the DCF Model and a five percent allowance for flotation costs as shown by the formula below:

$$k = \left[\frac{d_0(I+g)^{\frac{1}{4}}}{P_0(I-FC)} + (I+g)^{\frac{1}{4}} \right]^4 - I$$

THE QUARTERLY DCF MODEL

The simple annual DCF Model assumes that a firm pays dividends only at the end of each year. Since firms in fact pay dividends quarterly and investors appreciate the time value of money, the annual version of the DCF Model generally underestimates the value investors are willing to place on the firm's expected future dividend stream. In this appendix, we review two alternative formulations of the DCF Model that allow for the quarterly payment of dividends.

When dividends are assumed to be paid annually, the DCF Model suggests that the current price of the firm's stock is given by the expression:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_n + P_n}{(1+k)^n} \quad (1)$$

where

- P_0 = current price per share of the firm's stock,
- D_1, D_2, \dots, D_n = expected annual dividends per share on the firm's stock,
- P_n = price per share of stock at the time investors expect to sell the stock, and
- k = return investors expect to earn on alternative investments of the same risk, i.e., the investors' required rate of return.

Unfortunately, expression (1) is rather difficult to analyze, especially for the purpose of estimating k . Thus, most analysts make a number of simplifying assumptions. First, they assume that dividends are expected to grow at the constant rate g into the indefinite future. Second, they assume that the stock price at time n is simply the present value of all dividends expected in periods subsequent to n . Third, they assume that the investors' required rate of return, k , exceeds the expected dividend growth rate g . Under the above simplifying assumptions, a firm's stock price may be written as the following sum:

$$P_0 = \frac{D_0(1+g)}{(1+k)} + \frac{D_0(1+g)^2}{(1+k)^2} + \frac{D_0(1+g)^3}{(1+k)^3} + \dots, \quad (2)$$

where the three dots indicate that the sum continues indefinitely.

As we shall demonstrate shortly, this sum may be simplified to:

$$P_0 = \frac{D_0(1+g)}{(k-g)}$$

First, however, we need to review the very useful concept of a geometric progression.

Geometric Progression

Consider the sequence of numbers 3, 6, 12, 24, ..., where each number after the first is obtained by multiplying the preceding number by the factor 2. Obviously, this sequence of numbers may also be expressed as the sequence $3, 3 \times 2, 3 \times 2^2, 3 \times 2^3, \dots$. This sequence is an example of a geometric progression.

Definition: A geometric progression is a sequence in which each term after the first is obtained by multiplying some fixed number, called the common ratio, by the preceding term.

A general notation for geometric progressions is: a , the first term, r , the common ratio, and n , the number of terms. Using this notation, any geometric progression may be represented by the sequence:

$$a, ar, ar^2, ar^3, \dots, ar^{n-1}.$$

In studying the DCF Model, we will find it useful to have an expression for the sum of n terms of a geometric progression. Call this sum S_n . Then

$$S_n = a + ar + \dots + ar^{n-1}. \quad (3)$$

However, this expression can be simplified by multiplying both sides of equation (3) by r and then subtracting the new equation from the old. Thus,

$$rS_n = ar + ar^2 + ar^3 + \dots + ar^n$$

and

$$S_n - rS_n = a - ar^n,$$

or

$$(1 - r) S_n = a (1 - r^n).$$

Solving for S_n , we obtain:

$$S_n = \frac{a(1 - r^n)}{(1 - r)} \quad (4)$$

as a simple expression for the sum of n terms of a geometric progression. Furthermore, if $|r| < 1$, then S_n is finite, and as n approaches infinity, S_n approaches $a \div (1 - r)$. Thus, for a geometric progression with an infinite number of terms and $|r| < 1$, equation (4) becomes:

$$S = \frac{a}{1 - r} \quad (5)$$

Application to DCF Model

Comparing equation (2) with equation (3), we see that the firm's stock price (under the DCF assumption) is the sum of an infinite geometric progression with the first term

$$a = \frac{D_0(1+g)}{(1+k)}$$

and common factor

$$r = \frac{(1+g)}{(1+k)}$$

Applying equation (5) for the sum of such a geometric progression, we obtain

$$S = a \cdot \frac{1}{(1-r)} = \frac{D_0(1+g)}{(1+k)} \cdot \frac{1}{1-\frac{1+g}{1+k}} = \frac{D_0(1+g)}{(1+k)} \cdot \frac{1+k}{k-g} = \frac{D_0(1+g)}{k-g}$$

as we suggested earlier.

Quarterly DCF Model

The Annual DCF Model assumes that dividends grow at an annual rate of $g\%$ per year (see Figure 1).

Figure 1

Annual DCF Model

$D_0 = 4d_0$

$D_1 = D_0(1 + g)$

Figure 2

Quarterly DCF Model (Constant Growth Version)

$d_1 = d_0(1+g)^{.25}$

$d_2 = d_0(1+g)^{.50}$

$d_3 = d_0(1+g)^{.75}$

$d_4 = d_0(1+g)$

In the Quarterly DCF Model, it is natural to assume that quarterly dividend payments differ from the preceding quarterly dividend by the factor $(1 + g)^{.25}$, where g is expressed in terms of percent per year and the decimal .25 indicates that the growth has only occurred for one quarter of the year. (See Figure 2.) Using this assumption, along with the assumption of constant growth and $k > g$, we obtain a new expression for the firm's stock price, which takes account of the quarterly payment of dividends. This expression is:

$$P_0 = \frac{d_0(1+g)^{\frac{1}{4}}}{(1+k)^{\frac{1}{4}}} + \frac{d_0(1+g)^{\frac{2}{4}}}{(1+k)^{\frac{2}{4}}} + \frac{d_0(1+g)^{\frac{3}{4}}}{(1+k)^{\frac{3}{4}}} + \dots \quad (6)$$

where d_0 is the last quarterly dividend payment, rather than the last annual dividend payment. (We use a lowercase d to remind the reader that this is not the annual dividend.)

Although equation (6) looks formidable at first glance, it too can be greatly simplified using the formula [equation (4)] for the sum of an infinite geometric progression. As the reader can easily verify, equation (6) can be simplified to:

$$P_0 = \frac{d_0(1+g)^{\frac{1}{4}}}{(1+k)^{\frac{1}{4}} - (1+g)^{\frac{1}{4}}} \quad (7)$$

Solving equation (7) for k , we obtain a DCF formula for estimating the cost of equity under the quarterly dividend assumption:

$$k = \left[\frac{d_0(I+g)^{\frac{1}{4}}}{P_0} + (I+g)^{\frac{1}{4}} \right]^4 - I \quad (8)$$

An Alternative Quarterly DCF Model

Although the constant growth Quarterly DCF Model [equation (8)] allows for the quarterly timing of dividend payments, it does require the assumption that the firm increases its dividend payments each quarter. Since this assumption is difficult for some analysts to accept, we now discuss a second Quarterly DCF Model that allows for constant quarterly dividend payments within each dividend year.

Assume then that the firm pays dividends quarterly and that each dividend payment is constant for four consecutive quarters. There are four cases to consider, with each case distinguished by varying assumptions about where we are evaluating the firm in relation to the time of its next dividend increase. (See Figure 3.)

Figure 3

Quarterly DCF Model (Constant Dividend Version)

Case 1

$$d_1 = d_2 = d_3 = d_4 = d_0(1+g)$$

Case 2

$$d_1 = d_0$$

$$d_2 = d_3 = d_4 = d_0(1+g)$$

Figure 3 (continued)

Case 3

$$d_1 = d_2 = d_0$$
$$d_3 = d_4 = d_0(1+g)$$

Case 4

$$d_1 = d_2 = d_3 = d_0$$
$$d_4 = d_0(1+g)$$

If we assume that the investor invests the quarterly dividend in an alternative investment of the same risk, then the amount accumulated by the end of the year will in all cases be given by

$$D_1^* = d_1 (1+k)^{3/4} + d_2 (1+k)^{1/2} + d_3 (1+k)^{1/4} + d_4$$

where d_1 , d_2 , d_3 and d_4 are the four quarterly dividends. Under these new assumptions, the firm's stock price may be expressed by an Annual DCF Model of the form (2), with the exception that

$$D_1^* = d_1 (1+k)^{3/4} + d_2 (1+k)^{1/2} + d_3 (1+k)^{1/4} + d_4 \quad (9)$$

is used in place of $D_0(1+g)$. But we already know that the Annual DCF Model may be reduced to

$$P_0 = \frac{D_0(1+g)}{k-g}$$

Thus, under the assumptions of the second Quarterly DCF Model, the firm's cost of equity is given by

$$k = \frac{D_1^*}{P_0} + g \quad (10)$$

with D_1^* given by (9).

Although equation (10) looks like the Annual DCF Model, there are at least two very

important practical differences. First, since D_1^* is always greater than $D_0(1+g)$, the estimates of the cost of equity are always larger (and more accurate) in the Quarterly Model (10) than in the Annual Model. Second, since D_1^* depends on k through equation (9), the unknown “ k ” appears on both sides of (10), and an iterative procedure is required to solve for k .

COMPARATIVE RETURNS ON S&P 500 STOCKS
AND MOODY'S A-RATED UTILITY BONDS 1926-2019

RISK PREMIUM APPROACH

SOURCE OF DATA

Stock price and yield information is obtained from Standard & Poor's Security Price publication. Standard & Poor's derives the stock dividend yield by dividing the aggregate cash dividends (based on the latest known annual rate) by the aggregate market value of the stocks in the group. The bond price information is obtained by calculating the present value of a bond due in thirty years with a \$4.00 coupon and a yield to maturity of a particular year's indicated Moody's A-rated Utility bond yield. The values shown on the ex post risk premium schedule are the January values of the respective indices.

Calculation of Stock and Bond Returns

Sample calculation of "Stock Return" column:

$$\text{StockReturn}(2019) = \left[\frac{\text{StockPrice}(2020) - \text{StockPrice}(2019) + \text{Dividend}(2019)}{\text{StockPrice}(2019)} \right]$$

where Dividend (2018) = Stock Price (2018) x Stock Div. Yield (2019)

Sample calculation of "Bond Return" column:

$$\text{Bond Return}(2019) = \left[\frac{\text{Bond Price}(2020) - \text{Bond Price}(2019) + \text{Interest (2019)}}{\text{Bond Price}(2019)} \right]$$

where Interest = \$4.00.

**PREFILED TESTIMONY
OF
GEORGE ZANJANI**

**MOBILE HOMEOWNERS (C) INSURANCE RATE FILING
NORTH CAROLINA RATE BUREAU
FEBRUARY, 2021**

I. Qualifications and Summary

Q: What is your name, occupation, and business address?

A: My name is George Zanjani. I am Professor of Finance and the holder of the Frank Park Samford Chair of Insurance at the University of Alabama. My business address is 1074 Alderwood Lane NE, Marietta, Georgia 30068.

Q: Please describe your educational and employment background.

A: A complete curriculum vitae is attached as Exhibit RB-23 with this testimony. To summarize, my undergraduate studies were at Stanford University from 1987-1990, where I earned an A.B./B.S in Economics and Biology. I joined the commercial lines actuarial department of Fireman's Fund Insurance Companies in 1990 as an Assistant Actuarial Analyst. Upon leaving in 1994, I was a Senior Actuarial Analyst, an Associate of the Casualty Actuarial Society, and the head of the company's Workers Compensation actuarial unit. I did my graduate studies in Economics at the University of Chicago, earning a Ph.D. in 2000. I joined the Research Department of the Federal Reserve Bank of New York in the Capital Markets Function as a Research Economist in 2000, leaving as a Senior Economist in 2008. I joined the Robinson College of Business of Georgia State University in 2008 as an Associate Professor of Risk Management and Insurance and was honored as the inaugural holder of the AAMGA Distinguished Chair in Risk Management and Insurance in 2011. I started my current position in 2017.

Q: Please elaborate on some of your professional activities.

A: My professional career has been focused on insurance. After four years of actuarial work in commercial lines insurance, my dissertation addressed the economics of insurance pricing. I specialized on insurance issues while at the Federal Reserve Bank of New York. In particular, I served for the Bank on the Presidential Working Group on Financial Markets during its review of the renewal of the Terrorism Risk Insurance Act in 2006 and on the Committee on the Global Financial System Task Force on Institutional Investors, Global Savings, and Asset Allocation.

My academic service activities include 1) service as referee for various academic journals, 2) service as an associate editor of the *Journal of Insurance Issues*, and 3) (current) service as a senior editor for the *Journal of Risk and Insurance*. In addition, I have served on the Board of the American Risk and Insurance Association and served as President of that association. I have also served as President of the Risk Theory Society. I currently serve on the International Research Advisory Board of National Chengchi University.

As an academic, I continue to write on insurance pricing, participate in academic conferences on insurance, and engage in various sponsored research and consulting activities related to insurance. The latter activities include two research projects on capital allocation sponsored by the Casualty Actuarial Society during the last decade and a project on the financial crisis and the insurance industry sponsored by the Society of Actuaries in 2009. In addition, I have taught various courses at the undergraduate and graduate levels over the past decade, including classes on financial risk management, risk modeling, and property-casualty insurance.

Q: Have you published any papers or books?

A: Yes. I have published various articles, book chapters, reviews, and white papers on insurance pricing and other aspects of insurance markets. Published or forthcoming work includes articles on insurance topics in the *American Economic Review*, *Insurance: Mathematics and Economics*, the *Journal of Banking and Finance*, the *Journal of Financial Economics*, the *Journal of Public Economics*, the *Journal of Risk and Insurance*, *Management Science*, *North American Actuarial Journal*, and *Variance*. My co-authors and I have two chapters in the 2013 edition of the Handbook of Insurance, one on capital allocation for insurance companies, and the other on the financial pricing of insurance. Two papers have won awards for their contributions to the field of actuarial science: I received the 2010 ARIA award from the Casualty Actuarial Society and shared the 2015 Charles A. Hachemeister Prize (also from the Casualty Actuarial Society) with a co-author.

Q: Are you a member of any professional organizations?

A: I am a member of the American Economic Association, the American Finance Association, the American Risk and Insurance Association, and the Risk Theory Society. I am also an Associate of the Casualty Actuarial Society. I served on the Board of Directors of the American Risk and Insurance Association from 2007 to 2014 and served as President in 2012-2013. I served as President of the Risk Theory Society in 2012.

Q: Have you ever testified in insurance rate regulatory proceedings?

A: Yes. I have offered testimony for workers compensation insurance rate hearings in Florida (2015 and 2017), Virginia (2016), and Massachusetts (2020). I have also supplied testimony for the North Carolina Rate Bureau's rate filings in various lines since 2019.

Q: What was the nature of your testimony in those previous cases?

A: In these cases, I offered testimony on the underwriting profit factors used in the rates. Specifically, I evaluated the suitability of the methods and assumptions used to develop those factors, as well as whether the rate of return on capital implied by those factors was reasonable.

Q: What is the purpose of your testimony in this proceeding?

A: I was asked by the North Carolina Rate Bureau 1) to assist the Bureau committee with the underwriting profit factor selection, 2) to determine the expected return on insurance net worth implicit in the filing, and 3) to assess whether the expected return on net worth

constitutes a reasonable rate of return and thus whether the selected underwriting profit factor selection satisfies North Carolina's statutory requirements.

Q; Please summarize the main findings of your testimony.

A: Using a *pro forma* return model, I analyzed how the selected underwriting profit provisions used in the filing translate into expected returns on net worth. Consistent with previous filings, and with North Carolina law stipulating that the investment income earned on capital and surplus is not to be considered in determining the appropriate rate of return for the insurance industry, I refer to the expected return on net worth without including investment income on capital and surplus as the *statutory return*. When calculating the expected return on net worth including investment income earned on capital and surplus, I refer to the figure as the *total return*. My calculations for Mobile Homeowners (C) are detailed in Exhibits RB-24 and RB-25 and are summarized below:

Return Definition	Ex Liability	Liability
Statutory Return	6.87%	6.93%
Total Return	9.69%	9.78%

I then reviewed Dr. Vander Weide's testimony on the cost of insurance capital and considered other third-party estimates of the cost of insurance capital. I also considered adjustments to those cost of capital estimates that I deemed necessary for the North Carolina Mobile Homeowners insurance market. In particular, since non-public companies underwrite a portion of the market, I considered the effects of non-public ownership on the cost of equity. Ultimately, I found the expected returns implied by the underwriting profit provisions used in the filing to be reasonable and not excessive. Specifically, the expected returns fall toward the middle of the range of cost of equity estimates produced by Dr. Vander Weide and others.

Moreover, my conclusion is unchanged after adjusting the cost of capital to reflect both 1) the presence of debt financing at insurance holding companies and 2) a market value-to-book value premium at insurance holding companies. It is also unchanged after considering the impact of an alternative investment portfolio more closely matched to the portfolios of companies underwriting Mobile Homeowners insurance and to the yields currently available in the investment market.

II. Expected Return on Net Worth

Q: In general terms, how did you determine the expected return on net worth implied by the underwriting profit provision used in the filing?

A: I used a *pro forma* return model similar to that used in previous filings in North Carolina. The model accounts for underwriting income, installment payment income, investment income on unearned premium and loss/loss adjustment expense (LAE) reserves, and taxes as a percentage

of premium. Total after-tax income from these sources (as a percentage of premium) is then related to net worth (as a percentage of premium) to obtain an expected return on net worth.

Q: What do you mean by *pro forma*?

A: The model is *pro forma* in the sense that it assumes 1) that the indicated rate change will be implemented and 2) that all loss, expense, and investment return realizations will coincide with their projected expected values.

The results of the model and supporting information are presented in Exhibit RB-24 and RB-25.

Q: Could you state what you mean by “net worth”?

A: Net worth is the book value of equity of a company under Generally Accepted Accounting Principles (GAAP) rather than Statutory Accounting Principles (SAP).

Q: Did you account for investment income on capital and surplus in calculating the expected return?

A: It is my understanding that North Carolina law provides that insurance rates are to be set such that those rates are expected to provide a return to insurers that is equal to the returns of industries of comparable risk and that, in calculating that expected return, the investment income on capital and surplus is to be excluded from consideration. Therefore, I present the expected return projected to result from the selected underwriting profit provision excluding investment income on capital and surplus. However, for informational purposes, I also present the expected return projected to result from the selected underwriting profit provision including investment income on capital and surplus.

Q: Would you please elaborate on the elements of the return and how they are calculated?

A: The return is composed of underwriting profit (Line 2 of Exhibits RB-24 and RB-25, Pages 1 and 1A), installment fee income (Line 3 of Exhibits RB-24 and RB-25, Pages 1 and 1A) and investment gain on insurance transaction (Line 7 of Exhibits RB-24 and RB-25, Pages 1 and 1A). In the calculation that includes investment income on surplus for informational purposes, I additionally include investment gain on surplus (Line 8 of Exhibits RB-24 and RB-25, Page 1A). (Please note that, in my exhibits and sometimes in my testimony, I refer to investment income on surplus as a shorthand reference to investment income on capital and surplus.) All of the foregoing income components are adjusted for taxes. The components are discussed in greater detail below:

Underwriting profit and installment fee income - As a matter of arithmetic and definition, the underwriting profit as a percentage of premium matches the underwriting profit provision selected by the NCRB. It is the percentage of premium left over after accounting for the loss and expense provisions, with the projected loss and LAE ratio and fixed expense ratios being adjusted to reflect the indicated rate change. Installment fee income is based on the average installment charges as a percentage of premium over the past five years (Exhibits RB-24 and RB-25, Page 3). The underwriting profit income and installment fee income are both assumed to be

taxed at the current corporate rate of 21% (Line 4 of Exhibits RB-24 and RB-25, Pages 1 and 1A), as revised in the Tax Cut and Jobs Act of 2017. I also account for additional tax liabilities relating to IRS rules regarding the treatment of unearned premium reserves and of loss reserves (Line 5 of Exhibits RB-24 and RB-25, Pages 1 and 1A). Details of the calculation of these additional tax liabilities are found on Pages 4 to 6 of Exhibits RB-24 and RB-25.

Net Investment Gain on Insurance Transaction – This portion of the return reflects investment income on investible funds generated by the insurance transaction. Specifically, this quantity is calculated as the product of an investment yield and the average loss/LAE and unearned premium reserves that are actually held at the insurance company. An adjustment is made for investment income on agents balances (specifically, to account for the fact that agents balances, which are premiums held by agents and not yet remitted to the company, are not available for investment by the insurance company). In the case of the property lines (Mobile Homeowners C excluding Liability Insurance) analyzed in Exhibit RB-24, where a provision for reinsurance is included in the rate, I also adjust for investment income on reinsurance balances. This accounts for the additional income that the company receives on funds that have not yet been remitted to the reinsurer, as well as the investment income that it is not able to collect on funds that have not yet been recovered from the reinsurer. The details of the estimation of investible reserves and the investment income generated from those reserves are found on Pages 7 to 9 of Exhibits RB-24 and RB-25, with the adjustments for balances shown on Pages 1 and 2. The tax liability is based on a weighted average of estimated tax rates on the different sources of investment income, with the weights based on the composition of the overall property-casualty industry portfolio.

Investment Gain on Surplus – This portion of the return would reflect investment income generated from surplus. The investment yield is applied to investible surplus, the amount of which is based on the eight-year average premium-to-surplus ratio for groups writing Mobile Homeowners insurance in North Carolina from Page 14 of Exhibits RB-24 and RB-25. The tax liability is again based on a weighted average of estimated tax rates on the different sources of investment income, with the weights based on the composition of the overall property-casualty industry portfolio.

These components of after-tax return, all denominated as a percent of premium, are then summed and related to net worth. This is accomplished by multiplying the returns as percent of premium by the product of the premium-to-surplus ratio from Page 14 of Exhibits RB-24 and RB-25 and the inverse of the industry-wide net worth-to-surplus ratio from Page 15 of Exhibits RB-24 and RB-25.

Q: Please explain how the investment yield is calculated.

A: My understanding is that the conventional approach in North Carolina, based on a decision by the Commissioner in the 1990's, is to estimate the investment yield as an average of the "embedded yield" based on the industry statutory annual statement reports and a "current yield" based on current market rates. I have followed this convention in my analysis. For the current yield, I start with the overall industry invested asset portfolio and use various sources to estimate the current market yields for those assets. Sources for current market rates, and a summary of the overall calculation, are provided on Page 11 of Exhibits RB-24 and RB-25. For

each of the bond subcategories, I obtain a maturity distribution for the industry portfolio in that subcategory from the Schedule D summary exhibits and match each maturity level from the exhibits to a corresponding bond yield of similar maturity, so that the average yield shown on Page 11 is a weighted average across maturities according to the industry portfolio. The overall pre-tax current yield on the industry portfolio as thus determined is 2.56%. The embedded yield calculations, based on the actual investment income reported by the industry, are shown on Pages 12 and 13 of Exhibits RB-24 and RB-25; the pre-tax embedded yield is 3.81%. For the pro forma calculations, I average these two figures to obtain 3.19% (shown on Page 10 of Exhibits RB-24 and RB-25).

The tax liability for investment income is determined for each asset class, reflecting tax advantages as appropriate on municipal bond interest, preferred and common stock dividends, and capital gains on stock. Most of these rates are taken straight from the tax code for the respective asset class. However, to calculate the tax liability for the expected return on equity on Page 11 of Exhibits RB-24 and RB-25, we must split the return between capital gain and dividend components, since each has a different tax rate. We base the split on the experience of the S&P 500 over the 1998-2018 period.

Q: What is the expected return on net worth?

A: To calculate the implied return on insurance company equity, components of after-tax return are summed and related to net worth, which, as a percentage of premium, is calculated based on the product of the premium-to-surplus ratio from Page 14 of Exhibits RB-24 and RB-25 and the inverse of the industry-wide net worth-to-surplus ratio from Page 15 of Exhibits RB-24 and RB-25. This approach indicates that the selected underwriting profit factor of 6.5% for Mobile Homeowners C excluding Liability insurance, if achieved, would yield an expected statutory return on net worth of 6.87% (without including investment income on surplus) and a total return on net worth of 9.69% (when including investment income on surplus). For Mobile Homeowners C Liability insurance, the selected underwriting profit factor of 6.0%, if achieved, would yield an expected statutory return on net worth of 6.93% (without including investment income on surplus) and a total return on net worth of 9.78% (when including investment income on surplus).

Q: Have you considered the impact of any other alternative assumptions on your estimates?

A: Yes, I have considered the impact of alternative investment yield calculations.

First, I analyzed whether asset distribution supporting the actual underwriting of Mobile Homeowners insurance in North Carolina was reasonably approximated by the overall industry distribution. The models used to estimate the return on net worth in filings in North Carolina rely on the aggregated industry invested asset distribution. I have followed this convention in Exhibits RB-24 and RB-25, but I also considered using the premium-weighted asset distribution of carriers underwriting Mobile Homeowners insurance in North Carolina. This distribution ended up being significantly different from the overall industry distribution. In particular, the common stock allocation was only about 8%, which is significantly below the overall industry's aggregate allocation of over 25%. I explored the impact of the differences by substituting in the average allocation of the Mobile Homeowners insurers as calculated above. (I retained the

industry average bond allocation between the subcategories of bonds, as well as the industry figure for investment expenses.) The overall impact of this change was to reduce the estimated current portfolio yield to 1.15% from 2.56%. For Mobile Homeowners C excluding Liability insurance, this change had the effect of dropping the statutory return to 6.70% and the total return to 8.93%. For Mobile Homeowners C Liability insurance, this change had the effect of dropping the statutory return to 6.65% and the total return to 8.90%.

Second, I investigated the impact of basing the investment yield solely on the current yield. The practice of averaging embedded yields with current yields makes little difference when the yields are relatively close together. But the changes wrought by COVID-19 have opened up a significant divergence between the current yields on investments---which, in many cases, are close to all-time lows---and embedded yields---which reflect the market conditions of earlier years. The gap between the two is significant: the pre-tax current yield as calculated above is 1.15%, and the pre-tax embedded yield is 3.81%. If we calculate the returns on net worth using this current yield alone rather than the average, the rate of return drops further. For Mobile Homeowners C excluding Liability insurance, the statutory return drops to 6.36% (excluding investment income on surplus) and the total return drops to 7.36% (including investment income on surplus). For Mobile Homeowners C Liability insurance, the statutory return drops to 6.08% (excluding investment income on surplus) and the total return drops to 7.09% (including investment income on surplus).

Q: How was the underwriting profit factor determined?

A: The Bureau selected the 6.5% provision for Mobile Homeowners excluding Liability insurance and the 6.0% provision for Mobile Homeowners C Liability insurance. I participated in the Bureau's Property Rating Subcommittee meeting for the discussion of the profit portion of the rate review. I described for the committee my pro forma profit analysis and provided an array of underwriting profit provisions and their associated returns on net worth, both without including investment income on surplus and including investment income on surplus. The returns shown in that array spanned the range for the cost of equity that had been provided by Dr. Vander Weide. Following my presentation and the committee discussion, the committee selected the underwriting profit factor.

III. Rate of Return on Capital

Q: What steps did you take in the course of assessing whether the returns described above would produce a reasonable rate of return on equity?

A: I first reviewed Dr. Vander Weide's results. I then compared his results to other independent estimates based on various methodologies. I then made adjustments to both sets of estimates to account for the particular ownership structures that prevail in the North Carolina market. Finally, I compared the estimated statutory and total return on net worth determined in Section II above to these adjusted cost of equity estimates.

Q: What was the nature of Dr. Vander Weide's analysis?

A: The cost of equity for an industry is a difficult figure to pin down, and Dr. Vander Weide uses two approaches to estimate it. The first is a discounted cash flow (DCF) model, which estimates

the cost of equity under the assumption that the current equity price is a discounted present value of future dividend cash flows. The critical input to this calculation is the dividend growth rate estimate, which he bases on analyst forecasts. His final estimates under this approach are 8.9%, which he obtains when restricting his attention to forecasts for property-casualty firms specifically, and 10.7% when using forecasts for the S&P 500, which he views as having generally similar risk characteristics as the property-casualty industry. The second approach is a risk premium approach, which estimates the current cost of equity as a current bond yield plus a spread, or risk premium. This analysis, which uses the S&P 500 for purposes of estimating the risk premium, produces an estimate of 7.5%.

Q: How do Dr. Vander Weide's estimates compare with other estimates of the cost of equity for the industry?

A: The two methods employed by Dr. Vander Weide---the DCF and the risk premium method---are perhaps the two most widely accepted and widely deployed methods for estimating the cost of equity. However, there is substantial variation in implementation of these methods, which can have significant effects on the estimates. For example, the DCF/dividend growth model is sometimes estimated with different time period stages, with time-varying growth rates. There is also substantial methodological variation in implementation of the risk premium method---differences in averaging techniques, differences in the sample period used to estimate the risk premium, differences in the choice of the reference bond yield, differences in the methods used to estimate the relative risk of the industry of interest, and so forth. To get a sense of the import of these differences, I reviewed some additional third-party estimates of the cost of equity for the property-casualty industry, particularly those from Damodaran Online (an open-access website maintained by Aswath Damodaran, a valuation expert affiliated with New York University) and Duff & Phelps (a consultancy that took over the pioneering Ibbotson Cost of Capital franchise). The most recent estimates from Damodaran Online (January 2020) and Duff & Phelps (June 2020 edition of *Valuation Handbook – U.S. Industry Cost of Capital*, for the SIC Code Composite) are listed along with Dr. Vander Weide's estimates in the table below.

Property-Casualty Industry Cost of Equity Estimates

Source	Method	Estimate
James Vander Weide	Risk Premium	7.5%
Duff & Phelps	Risk Premium (CAPM)	7.0%
Damodaran Online	Risk Premium (CAPM)	5.5%
Duff & Phelps	Risk Premium (CAPM + Size Premium)	7.5%
Duff & Phelps	Risk Premium (Fama-French)	7.3%
James Vander Weide	DCF	8.9% to 10.7%
Duff & Phelps	DCF (1-stage)	6.1%
Duff & Phelps	DCF (3-stage)	11.8%

As can be seen from the table, Dr. Vander Weide's estimates are comparable to other estimates for the industry, falling within the range of those other estimates (5.5% to 11.8%).

Q: In the table, you also listed additional cost of equity estimates from Duff & Phelps. Can you explain these methods and their relevance to this filing?

A: Yes. While the CAPM and DCF methods are the basic models and are widely used, various extensions have gained acceptance over the years because of the need to draw finer distinctions among industries and firms when calculating the cost of equity. In particular, the “CAPM + size premium” recognizes the higher cost of capital endured by smaller firms and thus corrects for the average size of firms within an industry. The Fama-French-5-factor model extends the single risk factor framework of the CAPM to a five factor risk framework, thus pricing an industry’s equity on the basis of its sensitivity to four additional factors in addition to overall market returns. These methods typically produce higher estimates for the cost of equity in the property-casualty industry than the single factor risk premium model approaches. They provide additional perspective on the cost of equity.

Q: Do you believe any adjustments are necessary to the estimated cost of equity in the context of this filing?

A: Yes. All of the foregoing estimates are based on the data of publicly traded companies, which have the easiest access to financing and thus the lowest costs of capital. However, I found that operating companies affiliated with publicly traded holding companies wrote only 83.3% of the 2019 Mobile Homeowners direct premiums written for North Carolina. The remainder was underwritten by companies associated with private, often mutual, ownership---a segment well known to have more difficulty in accessing the capital markets. The industry average cost of equity needs to be adjusted upward to account for this non-public ownership.

Q: How much higher is the cost of equity for non-public firms?

A: Research dating back at least as far as the 1960’s has demonstrated that private equity trades at a substantial discount to public equity. The discount is thought to derive from a variety of factors, including the illiquid nature of private equity stakes (also known as a “lack of marketability”) as well as information, monitoring, and control issues. The discount translates into a higher cost of equity. For example, if a public firm’s cost of equity is estimated at 10% and the equity of a comparable private firm is selling at a 20% discount to that of the public firm, the private firm’s cost of equity would be estimated as:

$$12.5\% = 10\% / (1 - 20\%)$$

The discount is difficult to estimate. Exhibit RB-26 summarizes some of the academic research on the private firm discount. Studies have taken a variety of approaches to measurement. “IPO” studies compare the prices of pre-IPO share transactions in a private company with post-IPO share prices after the company is public. “Acquisition” studies compare the valuations of acquired private companies versus the valuations of acquired public companies. “Restricted stock” and “private placement” studies compare the prices of restricted stock issued by public companies with the prices of their traded shares.

All the approaches have their flaws. IPO studies, for example, are thought to have a bias toward overstating the discount because of the differences in timing of transactions. Restricted stock

and private placement studies tend to understate the discount: Since they confine their attention to public companies, they do not account for factors other than the discount for lack of marketability (DLOM), and, moreover, the actual restrictions on marketability for private placements have been loosened significantly over the years by the Securities and Exchange Commission.

On balance, however, the studies point to a substantial discount. For purposes of this testimony, I use a discount of 25%, which is somewhat below the average of the averages of the three groups in Exhibit RB-26 (when taking the midpoint of the ranges for the studies with ranges of estimates).

Q: How would this affect the estimated cost of equity for the industry?

A: Assuming a 25% private company discount and a 16.7% market share for non-public companies, I calculate adjusted estimates of the private cost of equity and the public cost of equity:

$$16.7\% * \left(\frac{COE}{(1 - 0.25)} \right) + (83.3\%) * (COE),$$

where *COE* is the estimated cost of equity for public companies. The adjusted estimates are as follows:

Cost of Equity Estimates, Adjusted for Non-Public Ownership

Source	Method	Adjusted Estimate
James Vander Weide	Risk Premium	7.9%
Duff & Phelps	Risk Premium (CAPM)	7.4%
Damodaran Online	Risk Premium (CAPM)	5.8%
Duff & Phelps	Risk Premium (CAPM + Size Premium)	7.9%
Duff & Phelps	Risk Premium (Fama-French)	7.7%
James Vander Weide	DCF	9.4% to 11.3%
Duff & Phelps	DCF (1-stage)	6.4%
Duff & Phelps	DCF (3-stage)	12.5%

Q: How do these figures speak to the issue of whether or not the pro forma expected return on net worth is reasonable?

A: There are at least two schools of thought on this issue.

The first is that the “net worth” in the pro forma return exhibit should be interpreted as an equity investment akin to the equity analyzed by Dr. Vander Weide and others. Thus, it should be entitled to a similar rate of return. Under this school of thought, the return on net worth calculated in the previous section should be compared directly with the figures in the table above. If one does this, the projected returns are, in my opinion, clearly not excessive, even when including investment income on surplus in the calculation of the return. The projected total returns of 9.69% for Mobile Homeowners C excluding Liability insurance and 9.78% for

Mobile Homeowners C Liability insurance both fall a bit above the middle of the span of estimates above, which range from 5.8% to 12.5%. If one instead focuses on the statutory return by excluding investment income on surplus, the figures of 6.87% and 6.93%, respectively, fall toward the lower end of the range of estimates.

A second school of thought is that, although the capital of the operating subsidiaries may be fully financed by equity, one should “look through” the operating subsidiaries to the level of the holding companies to determine a cost of capital, which is important because the holding companies---unlike the insurance subsidiaries---typically hold some debt in the capital structure. Holding companies that are typically classified as property-casualty companies have, in recent history and on average, had in the neighborhood of 20% debt. Thus, the cost of capital for the holding company is, under this school of thought, calculated as a weighted average of the cost of equity and the cost of debt, with the weights based on each component’s share of the capital structure. The result is a weighted average cost of capital (WACC), which is typically lower than the cost of equity as a reflection of the lower cost of debt. On the other hand, another consideration is that the market value of the capital of the holding company will be different than the book value of the capital invested in the insurance subsidiaries. Thus, a particular return on net worth at the level of the operating subsidiary will translate into a lower (higher) return on holding company capital if the market value of the holding company capital exceeds (is less than) the net worth of the insurance subsidiaries.

The following table shows the most current WACC estimates for the property-casualty industry from Damodaran Online and Duff & Phelps, after adjusting the cost of equity for non-public ownership as described above. It also shows the required return on operating company net worth under different assumptions about the ratio of holding company equity market capitalization to holding company net worth and under the assumption of 20% debt (trading at par) in the capital structure. For example, the required return on operating company net worth for a WACC estimate of 10.0% and a Market-to-Net Worth Ratio of 1.2, would be:

$$10\% * (1.2 * 80\% + 20\%) = 11.6\%$$

Note that the WACC estimates vary, due not only to the previously described differences in estimating the cost of equity, but also due to different estimates for the cost of debt and for the share of debt in the capital structure.

Property-Casualty WACC Estimates, Adjusted for Non-Public Ownership

Source	Method	Adjusted WACC Estimate	Required Return on Net Worth, Assuming Market-to-Net Worth Ratio of:		
			1	1.2	1.4
Duff & Phelps	Risk Premium (CAPM)	6.7%	6.7%	7.8%	8.9%
Damodaran Online	Risk Premium (CAPM)	5.0%	5.0%	5.8%	6.6%
Duff & Phelps	DCF (1-stage)	5.9%	5.9%	6.8%	7.8%
Duff & Phelps	DCF (3-stage)	10.8%	10.8%	12.6%	14.3%
Duff & Phelps	CAPM + Size Premium	7.1%	7.1%	8.3%	9.4%
Duff & Phelps	Fama-French	6.9%	6.9%	8.0%	9.2%

At current stock market valuations, the market-to-net worth ratio of the public companies underwriting Mobile Homeowners insurance in North Carolina is typically well above 1. However, even if one sets this ratio to 1, the table above shows a range of 5.0% to 10.8%. This suggests that total returns on capital of 9.69% for Mobile Homeowners C excluding Liability insurance and 9.78% for Mobile Homeowners C Liability insurance are reasonable and not excessive, and the same characterization applies to the statutory returns on capital of 6.87% and 6.93% (respectively). The same conclusion applies if we consider the alternative investment yield assumptions discussed above, which would drop the total returns on capital to 7.36% for Mobile Homeowners C excluding Liability insurance (7.09% for Mobile Homeowners C Liability insurance) and the statutory returns on capital to 6.36% for Mobile Homeowners C excluding Liability insurance (6.08% for Mobile Homeowners C Liability insurance).

In summary, the expected return on net worth calculated in Section II is, in my opinion, consistent with a reasonable and not excessive return on invested capital.

IV. Conclusion

Q: Based on your knowledge and experience and on the studies and analyses you have performed, have you come to any conclusions regarding the underwriting profit factor selected by the Bureau and used in its indicated rate level calculations in this filing?

A: Yes. Based on my pro forma return analysis, I found that the expected statutory return on net worth implied by the selected 6.5% underwriting profit factor for Mobile Homeowners excluding Liability insurance was 6.87% (not including investment income on surplus). The expected total return on net worth was 9.69% (including investment income on surplus). Adjusting

prospective investment returns to account for the asset distribution of the companies underwriting Mobile Homeowners insurance in North Carolina and for the low current level of yields would reduce these figures to 6.36% and 7.36%, respectively. For Mobile Homeowners C Liability insurance, the selected underwriting profit factor of 6.0% yields an expected statutory return of 6.93% and an expected total return of 9.78%. Adjusting prospective investment returns to account for the asset distribution of the companies underwriting Mobile Homeowners insurance in North Carolina and for the low current level of yields would reduce these figures to 6.08% and 7.09%, respectively.

In any case, after reviewing and analyzing the cost of capital estimates for the industry produced by Dr. Vander Weide and others, I found the expected returns on net worth resulting from the selected underwriting profit factors to be consistent with a reasonable and not excessive return on invested capital. Thus, I believe that the selected underwriting profit factors are reasonable and not excessive.

An important caveat to this analysis, however, is that all conclusions are predicated on the assumption that the indicated rate level is achieved. In the event that a lower rate level is implemented, the expected rate of return could be inadequate.

Mobile Homeowners C ex. Liability Insurance**

**Projected Investment Earnings on Loss, Loss
Adjustment Expense and Unearned Premium Reserves**

A. UNEARNED PREMIUM RESERVES

1. Direct Earned Premiums		1,000,000
2. Mean Unearned Premium Reserve	53.29%	532,944
3. Deductions for Prepaid Expenses		
Commissions & Brokerage	17.90%	
Taxes, Licenses, & Fees (5/6)	2.58%	
Other Acquisition & General (1/2)	6.92%	
Cost of Reinsurance	21.93%	
Total	49.33%	
4. Deduction for Prepaid Expense: (2) x (3)		262,897
5. Net Unearned Premium Reserve Subject to Investment (2) - (4)		270,047

B. Loss and Loss Expense Reserves

1. Direct Earned Premiums		1,000,000
2. Expected Net Incurred Loss & LAE-to- Direct Premium Ratio	34.06%	340,587
3. Expected Mean Loss and LAE Reserve-to-Incurred Ratio	39.37%	134,081

C. Net Policyholder Funds Subject to Investment (A5 + B3) 404,128

D. Average Rate of Return 3.19%

E. Investment Earnings from Net Reserves: (C) x (D) 12,882

F. Average Rate of Return as a Percent of Direct Earned Premiums: (E) / (A1) 1.29%

NORTH CAROLINA
Mobile Homeowners C ex. Liability Insurance

**ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES**

EXPLANATORY NOTES

Line A-1

Calculations displayed are per million of direct earned premiums.

Line A-2

The mean unearned premium reserve (UEPR) is determined by multiplying the direct earned premiums in line (1) by the ratio of the mean unearned premium reserve to the direct earned premium for the current calendar year ended 12/31. The data are for North Carolina Homeowners (NC HO) insurance (from statutory Page 14 of the Annual Statement) for all companies which wrote Mobile Homeowners C in the most recent calendar year. Volume amounts are in thousands of dollars.

1 NC HO Direct Earned Premium for most recent calendar year	121,061
2 NC HO UEPR at end of most recent calendar year	64,858
3 NC HO UEPR at end of previous calendar year	64,179
4 Mean NC HO UEPR	64,519
5 Ratio [(4) / (1)]	53.29%

Line A-3

Deduction for prepaid expenses

Certain production expenses, such as commissions and reinsurance, are assumed to be incurred when the policy is written and before the premium is paid. In addition, half of Other Acquisition and General expenses and 5/6 of Taxes, Licenses and Fees are assumed to be prepaid.

NORTH CAROLINA
Mobile Homeowners C ex. Liability Insurance

**ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES**

EXPLANATORY NOTES

Line B-2

Ratio is calculated as the expected direct loss and LAE ratio from Page 1 minus the difference between the total cost of reinsurance from Line A-3 and the net cost of reinsurance from Page 1.

Line B-3

The mean loss reserve is calculated by multiplying the incurred losses in (2) by the ratio for mean loss reserves to incurred losses. The latter figures are based on total statutory Page 14 figures for North Carolina Homeowners direct losses incurred and direct losses unpaid for all companies writing Mobile Homeowners C in North Carolina in each year. The adjustment for loss expense reserves is based on nationwide industry aggregates for the HO line. Volume amounts are in thousands of dollars.

EXPLANATORY NOTES

Line E

The average rate of return is the average of the pretax current yield calculated on Page 11 and the pretax embedded yield. The embedded yield (see Page 12) is the sum of the ratio of investment income to invested assets for the most recent year plus the ten year average ratio of capital gains to invested assets (see Page 13). The current yield is the estimated currently available rate of return (including both income and capital gains) on the industry investment portfolio (see Page 11).

Embedded Yield	3.81%
Current Yield	2.56%
Average	3.19%

NORTH CAROLINA
Mobile Homeowners C Liability Insurance

**ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES**

EXPLANATORY NOTES

Line A-1

Calculations displayed are per million of direct earned premiums.

Line A-2

The mean unearned premium reserve (UEPR) is determined by multiplying the direct earned premiums in line (1) by the ratio of the mean unearned premium reserve to the direct earned premium for the current calendar year ended 12/31. The data are for North Carolina Homeowners (NC HO) insurance (from statutory Page 14 of the Annual Statement) for all companies which wrote Mobile Homeowners C in the most recent calendar year. Volume amounts are in thousands of dollars.

1 Direct Earned NC HO Premium for most recent calendar year	121,061
2 NC HO UEPR at end of most recent calendar year	64,858
3 NC HO UEPR at end of previous calendar year	64,179
4 Mean NC HO UEPR	64,519
5 Ratio [(4) / (1)]	53.29%

Line A-3

Deduction for prepaid expenses

Certain production expenses, such as commissions and reinsurance, are assumed to be incurred when the policy is written and before the premium is paid. In addition, half of Other Acquisition and General expenses and 5/6 of Taxes, Licenses and Fees are assumed to be prepaid.

**NORTH CAROLINA
Mobile Homeowners C Liability Insurance**

**ESTIMATED INVESTMENT EARNINGS ON UNEARNED
PREMIUM RESERVES AND ON LOSS RESERVES**

EXPLANATORY NOTES

Line B-2

The expected loss and loss adjustment expense ratio is consistent with the expense provisions used in the filing.

Line B-3

The mean loss reserve is calculated by multiplying the incurred losses in (2) by the ratio for mean loss reserves to incurred losses. The latter figures are based on total statutory Page 14 figures for North Carolina Homeowners direct losses incurred and direct losses unpaid for all companies writing Mobile Homeowners C in North Carolina in each year. The adjustment for loss expense reserves is based on nationwide industry aggregates for the HO line. Volume amounts are in thousands of dollars.

EXPLANATORY NOTES

Line E

The average rate of return is the average of the pretax current yield calculated on Page 11 and the pretax embedded yield. The embedded yield (see Page 12) is the sum of the ratio of investment income to invested assets for the most recent year plus the ten year average ratio of capital gains to invested assets (see Page 13). The current yield is the estimated currently available rate of return (including both income and capital gains) on the industry investment portfolio (see Page 11).

Embedded Yield	3.81%
Current Yield	2.56%
Average	3.19%
